Interesting problems indeed. Only suggestion I have is to not
use the built in GFA event calls "ON MENU xxx" instead you can
accomplish the same with the EVNT_MULTI() call. The difference
being that internally GFA uses evnt_multi() anyway and it may not
be handled correctly. I alway use EVNT_MULTI() and the "ON MENU"
commands and I've not seen any problems here like you described.
I am using TOS 3.06 however.

These applications are using evnt_multi(). First you should do that,
too, because all the GFA-ON MENU-constructions are buggy. Nobody knows,
what happens inside ...

Moreover you should preconceive that mouse- and keyboard-events normally
are send to the application which is the top-windows owner. That applys
particularly in multitasking-environments.

Hi!

> If anyone has installed Linux on a Falcon030 I could use your guidance.

I was installed Linux on my F030 few days ago ...
In DEBIAN distibution (2 CD's) it's very easy to install Linux, but you
need math coprocesor and 14 MB of RAM.

> I am looking for HowTos and FAQ's/Walkthroughs on installing and make a
> stable build of Linux on a Falcon030

It's included on 1ST CD of distribution.

It depends upon how old it is. Talking of ST or STf models, the older ones
had single sided drives, maybe up to 1988. I think STe models were all
double sided, but I'm not sure.

Anyway, open it and check your drive...

Try formatting at 720K! If it works, and gives no errors it's double-sided,
otherwise it's a 360K single-sided drive.

Seeing as this is posted to a programmer newsgroup...

Try reading a sector from a floppy disc formatted as double sided...

Something like this (using the appropriate values where noted):

```
#include <osbind.h>

int main( void )
{
     schar8 buffer[512];

     return Rwabs( READ, buffer, 1 sector, (sector 0, side 1), Drive B );
}
```

If Rwabs returns zero, you have a double sided drive, else if it returns a negative number then it is a single sided drive (or else Rwabs just had trouble reading that sector)

Seeing as this is posted to a programmer newsgroup...

Try reading a sector from a floppy disc formatted as double sided...

Something like this (I'll leave you to add the UI and so forth)

```
#include <osbind.h>

int main( void )
{
     schar8 buffer[512];

     return Floprd( buffer, 0L, 1, 0, 0, 1, 1 );
}
```

If Floprd returns zero, you have a double sided drive, else if it returns
a negative number then it is a single sided drive (or else Floprd just had
trouble reading that sector [in this case sector 1, tract 0, side 2 of
drive B])

>wind_set(0, WF_NEWDESK, NULL, 0);

That's of course the first thing I tried. But, alas, fraught with difficulties. In the first place, the desktop is not redrawn. It is only redrawn for the portions that are changed afterwards, i.e. when moving or closing windows. And in the second place, the "new" desktop is always the old-fashioned grey background instead of the coloured background you get under a modern OS, like MagiC. So how can I get the desktop to be redrawn, short from opening and closing a desktop-wide window? And how do I get to the desktop currently in use by the OS?

Hi, I have 5 Atari items for sale. To make things fair for everyone,
I posted them on E-bay, so that everyone will have a fair chance.

Here's the stuff:

Atari Computer Power Supply, +5v, -12v, +12v
Atari Replacement ST Keyboard, BRAND NEW!!!
Atari "Side Board" for 810 computer NEW!!
Atari Power Adaptor Part No: C018187 11.5vdc
Atari 9 Volt AC Supply Part No: C017945

Go to this shortcut to get to my e-bay items.

http://www.elpro.com/img/

All of this stuff is in new or like new condition. Power supplies have been tested.

Good luck.

If you're talking about the fill with zeroes/ones blits, that is not a
bug in FalconTC but in some documentation and header files.

> The resulting bitmaps look correct except for the colours. So I

It would.

The normal work of a standard to device specific vr_trnfm is to reorder
the separate bit planes into the Atari interleaved layout. Graphics
cards, and FalconTC for that matter, don't use bit planes, however, so
something else needs to be done.

In a byte per pixel mode there's still a palette, so the only thing
that's needed is to combine eight words at a time into 16 separate 8 bit
pixel values. There's nothing for you to worry about there.

In 16 bit mode there's still a need to combine bits into 'chunky'
pixels, in this case a word per pixel. Unfortunately, it's not possible
to use this combined value on the display since it's only a palette
index and you need the actual colour value (RGB components). It would
have been nice if the VDI had done this for you (preferably using the
palette for the workstation in question), but for some reason Atari
decided that the Falcon vr_trnfm should only do the bit combining.
The conversion to a real colour value is done afterwards by the AES
using a look-up-table (with the 256 16 bit values of the normal palette).
IIRC, vr_trnfm delivered the bits in the opposite order to what the AES
wants so there was some bit reversal going on before the table look-up.
Also, for proper masking of icons in true colour, the 'transparent'
background needs to be black (colour value 0) rather than white (palette
index 0), so the AES (again, IIRC) does some pre-processing to modify
the white and black pixels.

Finally, there has never been an Atari TOS machine with 24/32 bit colour,
so the AES doesn't know that it may need to treat this similarly to
16 bit. It simply does a straight vr_trnfm and expects the resulting
values to be directly usable. This means that the VDI has to do the
palette look-up itself in this case.

This is all a mess and I intend to add support in fVDI for the new
NVDI 5 things someone mentioned so that we don't have to worry about
it in the future.

>guess what I am looking for is how to properly get these colors to appear
...
> I imagine it's something fairly simple in effect. A matter of

Not quite.

> I would have thought that this would have been the correct method

>since the vdi pens in 16bit color and up only apply to the drawing of
>pixels and don't actually change any colors already on the screen.

The problem is that those pens aren't used by vr_trnfm either in 16 bit.

> Do I have to manually go through the resulting image and redraw
>all the pixels into the correct colors?

You could do that. Positive Image does this in its 'VDI mode', but it's
very slow.

A much better way is to draw test pixels with suitable red, green and
blue values (one at a a time), blit them back to a table and then do
some ORing for each pixel while writing to an MFDB that can then be
blitted to the screen. Done properly, that will deal with any bit
layout without problems.
There is a library that does this for you. Wasn't it written by Guido
something?

>>If you want to see how fVDI does the reverse of what you're looking
...
> I might just do that if I can't figure out where to go from here.

Well, I've added the relevant parts below in any case.
Perhaps they can make a few things clearer. Note especially the
differences between the 16 bit and 32 bit versions.

The following code snippets are run after the initial word reordering
that is the same for all bit depths. For the bit plane modes, no more
work is needed.
This code is used right now and seems to be completely compatible with
the normal AES and desktop. If anyone discovers any problems with it,
please let me know.

I'm well aware that the code is quite slow, but I needed something that
was easy to hack around in while I was trying to figure out how this
was supposed to work. It'll all be rewritten later on.

```
* 16 bit vr_trnfm post-processing (we're still inside vr_trnfm)
     move.l   mfdb_address(a2),a4
     move.w   mfdb_height(a1),d0

     subq.w   #1,d0
.l0:
     move.w   mfdb_wdwidth(a1),d1
     subq.w   #1,d1
.l1:
     movem.l  (a4),d2-d7/a5-a6   ; Copy a batch of words to a
     movem.l  d2-d7/a5-a6,(a3)   ;  temporary buffer to simplify
     moveq    #15,d3             ;  things a bit
.l2:
     moveq    #30,d4
```

```

MiNT must save and restore the FPU registers on every context switch. If
your hardware isn't really stable that can cause problems. But it'S a
hardware problem.

You can compile a MiNT kernel for yourself and completly disable the FPU
register saving :-).

Tschuess

Hi there !

Does one of you know how works the .HRD file format ?

It seems that before the name of an object there's its number,
but I don't understand how to know the offset betwen objects...

I'd be realy interested also on the international (multilangue) file
format of Ressource Master, so I could include that in my own
RSC editor.

BFN,

Thomas (the autor of the RSC editor for Dolmen : Fashion)

This format is documented in my WERCS editor manual.

It says the object names vary in size and are terminated by a null
byte. The object name ends the record for that object.

So each object record could be different size.

That help?

Some psuedocode for formatting one side. Just bung the lot in a loop
for the number of sides (2 strangely enough)...

```
side = 0;
MAGIC = $87654321;
BLANK = $E5E5;

//buffer
BYTE p[];
p = Malloc(9 * 1024);

//format each track
for track = 0 to 79
     status = Flopfmt(p,1,9,track,side,1,MAGIC,BLANK);

     if status <> 0
     failed;
     fi
rof

//blank the whole buffer...
for i = 0 to 79
     p[i] = 0;
rof

//...cos that'll now clear the FAT etc
for track = 0 to 1
     status = Flopwr(p,0,1,1,track,0,9);

     if status <> 0
          failed;
     fi
rof

//have system construct bootsector
//One of the args for both funcs below
//is the 'side', I forget which
//[hence reason it isn't a DS example]
Protobt(p,Random(),2,0);
status = Flopwr(p,0,1,1,0,0,1);
if status <> 0
     failed;
fi

//hand back buffer
Mfree(p);

//[may want to Flopver() here]
```

Hello everybody!

I started GEM-Programming a few months ago and I have a problem
with the slider-handling.
Following situation:
My Program opened a window and jumped into a event-loop (using
evnt_multi or evnt_mesag).
When I click an arrow the Program recieves the messages such as
WA_DNPAGE, WA_UPPAGE etc
twice. So that my Program scrolls up/down/left/right two pages.
With Magic everything works fine.
I did test it on a MegaSTE with TOS 2.06 and a Falcon with TOS 4.04. On
both Computers all
Messages depending the Sliders are sent twice. Now I want to ask: Is it
a bug in TOS or
is there a way to handle the sliders in a "correct" way?
I simply did something like this:

```
[...]
switch msg_buff[4]
{
case WA_UPPAGE:
 ---scroll up---
 break;
case WA_DNPAGE:
 ---scroll down---
 break;
[...]
```

By the way: I use Lattice C 5.60.

Thanks for tips and tricks
Heiko

It is a bug in the AES (fixed by WINX), but there's an easy way to work
around it: Simply wait for double clicks in your event loop, whether you
actually need them or not.

Ciao

Thomas

P.S. You should check your settings, writing as "root
     <ossi@machine.ruhr.de>" isn't a really bright idea, IMO ;)

Hello,

I have some Atari StE's, and am interested in accquiring a hard drive.
Either proper Atari ones or a nice cheap solution using something else (?).
By cheap, I mean I don't want to spend more than 100UKP at most.

Thanks!

Hi Heiko,

you did it right. It's a bug in TOS (AES).

You should get the timerticks of your systemclock between two events and
"eat" the second message if it comes too fast.

```
 oldticks = 0;
 switch msg_buff[4]
 {
 case WA_UPPAGE:
    if ( nowticks() > (oldticks + 50) ) // is the last message older than 50
timerticks (0.25 seconds) ?
        oldticks = nowticks();
      ---scroll up---
  break;
 case WA_DNPAGE:
  ---scroll down---
  break;
 }
```

There is no Bios function to use for nowticks(), but I would read the
system variable at address $0004BA (_hz_200). The value of this address
increments 200 times per second.

```
long nowticks()
{
        long *lptr;

        lptr = 0x4BA;

        return( *lptr );
};
```

My C-knowlegde is a bit old, but it may work.

good luck

Stefan

You might look for a used Syquest drive (44, 88 or 135 meg drives and
something like a ICD Link 1 or 2 as a host adaptor.) Works great on
an ST.

Mike

Mario Becroft at http://www.ak.planet.gen.nz/~mario/ sells an adaptor which
will allow an IDE drive to be fitted to an ST. The driver is $NZ150, which
is around 50 pounds, plus postage. On top of that, you have the cost of a
drive. Using Mario's adaptor a 2.5" laptop drive can be fitted inside the
STe's case, or you can use a free standing unit outside the case. The
adaptor fits in the cpu socket and comes with an upgrade to tos 2.6

I hat the same Idea, too. The time the mouse-button is held down might be so
long that the computer sends 2 messages. But I thought that this should happen
by other events too. But WM_CLOSED, FULLED etc are sent correctly. So I thought this
could not be the reason.
But Thomas Binders suggestion to wait for a doubleclick works fine. I used evnt_multi only
only with the MU_MESAG flag. (I think its funny that MU_MESAG alone is
buggy, but if you wait for mouseclicks AND message-events everything
works fine :-))

I think I will wait for mouseclicks until I have more experience in programming
Ataris.

Thanks to all who helped me!!!
Heiko

Hey all!

Please read quick and see if you can help!

There is an Atari ST running an automated mailer machine, and
the company want to replace it with a PC. I am now trying to get
an emulator to work well under Win95, that allows for communication
via the serial port to the mailer machine.

I have tried WinSTon, TOSBox etc etc but when I use the original

ST disks to boot up in the PC, the second disk causes 3 BOMB
icons to appear on the screen and it hangs.....

So now I dont know what to do! Any suggestions????

Thanks
RN

Get both at ftp://ftp.lip6.fr/pub/atari/Programming/
(get 1st its index(es):
ftp://ftp.lip6.fr/pub/atari/Programming/Index

> if there is one available for purchasing, where I could get it.
   AFAIK there are no more to purchase...

> want to do some graphics programming and see how fast I can get this
> beast to run in 3d. Which reminds me, I guess I would somehow need
   Calm down guy, the "beast" has only a 8MHz 68000... so don't expect
too much from it...

> to find information on the graphic card (video modes, software
> interrupts, etc.) so i could do graphics programming. Anyways peace
Video modes :
 - basic ones available: 320x200x16c(colors, not bits) or 640x200x4c or
640x400x2c (monochrom B&W, this one needs a special monitor whereas the
two others works on a TV or standard monitor)
 - AFAIR you can extend it by various software dirty incompatible time-

consuming tricks up to 448x272x16 (max I think, very tricky, needs half
processor power to sustain it... and lots more to fill it with
pixels...)
Software interrupts:
On Atari system, you do not need them for graphic programming (apart
from color rasters :)...).

> out, and any help is defintely appreciated.
Hope this helps.

Can somebody explain why the following doesn't work under Geneva?

```
int work_in[11]={1,1,1,1,1,1,1,1,1,1,2};
int work_out[57], vw_handle;

work_in[0] = Getrez() + 2;
v_opnvwk(work_in, &vw_handle, work_out);
```

Under N.AES and MagiC this works fine, but under Geneva wv_handle is
always 0, which indicates that the call failed.

Hi Jo!

JES>Can somebody explain why the following doesn't work under Geneva?
JES>
JES>int work_in[11]={1,1,1,1,1,1,1,1,1,1,2};
JES>int work_out[57], vw_handle;
JES>
JES>work_in[0] = Getrez() + 2;
JES>v_opnvwk(work_in, &vw_handle, work_out);
You have to initialize vw_handle with the handle of the physical workstation
(not only workin[0]). vw_handle is an input _and_ output parameter

Bye

Joerg

Greetings all,

I wonder if it is possible to determine how many object trees that exists in a RSC-file? I anyone knows how to do this from GFA I would be even happier! :)

Regards,

Joakim

I know, and I did. The problem appeared to be Thing, *all* applications
failed this way when I ran Thing under Geneva.... Sorry for the
inconvenience folks.

Taskbar now works fine under Geneva, have a look at

http://atari.nvg.org/Taskbar/ for proof :-)

Hi!

Jo Even Skarstein <joska@nvg.ntnu.no> wrote:
> work_in[0] = Getrez() + 2;

You don't want to do that ... Always supply 1 here, which means "use the current driver/resolution". Getrez() in a GEM application is a Bad Thing (TM). I know this is stated in some docs, but it's for v_opnwk() (i.e. a PHYSICAL workstation), when you want to have a workstation with other than the current resolution. Forget it when using v_opnvwk().

Ciao

Thomas

   (Almost) all you need is here:
http://wombat.ludvika.se/dhs/files.html#misc
   The fastest DSP-assembler (lacks some preprocessing features though):
ftp://ftp.lip6.fr/pub/atari/Falcon/Programming/qdspv010.lzh
   And probably some more things at:
ftp://ftp.lip6.fr/pub/atari/Falcon/Programming/

Bye,

Is this possible in a program designed to run from the AUTO folder:

 - call M(x)alloc & Mfree
 - launch child processes with Pexec
 - make file i/o (Fread, Fwrite, etc.)
 - and as a whole use GEMDOS?

And also: can GEMDOS be used in the boot sector? for file i/o?

Thanks in advance for your answers,
   G.

Hi!

SEVIN Roland <upsis@club-internet.fr> wrote:
> Try This (Pure ASM), OK with MagiC, MagicPC,...

> [LineA-Code snipped]

I hope you'll /never/ use this in an application, especially if it's supposed to work on machines with a graphics card. LineA is _obsoleted_, furthermore Atari has _never_ allowed _writing_ to the negative offset variables.

appl_tplay() works OK on all machines, it's just appl_trecord() that has problems, but this isn't necessary for positioning the mouse cursor or simulating any other AES event.

Ciao

Thomas

Thanks, I wasn't aware of this. The Atari Compendium tells me to use it,
so I did ;-)

After you load your RSC file with rsrc_load() the starting adress of
the block of ram used to load the RCS file is placed into one
of the AES global arrays. You can look there as the header to the
resource file contains the total trees.

I wrote this from memory but I think it will work. If you need
some actual code to do this maybe I can find it.

It's the 12th 16-bit word in the RSC file header.

(Sorry its not in GFA, but this C code should suffice)

#include <osbind.h>

```
// return number of OBJECT trees in resource file
// INPUT  filename  (pointer to string of 8-bit signed chars)
// OUTPUT answer    (number of trees) or zero if an error occurs
uint16 num_trees( schar8 *filename )
{
     sint16 handle;     // file handle  (signed 16-bit integer)
     sint16 header[18]; // file header (array of 16-bit ints)

     // use GEMDOS to open file
     handle = Fopen( filename, READ );
     if( handle < 0 )   // error - return zero
          return 0;

     // read header into memory
     Fread( handle, sizeof( header ), header );

     // don't forget to close the file!
     Fclose( handle );

     // return word 12 of array (offset 24)
     // note: C arrays are indexed from zero, so array[11] is 12th
     //       array member
     return header[11];
}
```

Like Thomas says, it'll be the "Getrez()+2" section then. I've had it
fail (unexpected at the time) myself, which implies MagiC 2 rejects it
also. Can't be sure - simply that at some time it *must* have failed
under something else I'd never had known!

From MWC gemdefs.h ...

```
typedef struct rshdr
{
int      rsh_vrsn;/* Resource structure version #  */
unsigned int  rsh_object;   /* Offset to first object   */
unsigned int  rsh_tedinfo;  /* Offset to first tedinfo  */
unsigned int  rsh_iconblk;  /* Offset to first iconblk  */
unsigned int  rsh_bitblk;   /* Offset to first bitblk   */
unsigned int  rsh_frstr;    /* Offset to free string index
     */
unsigned int  rsh_string;   /* Offset to string data    */
unsigned int  rsh_imdata;   /* Offset to image data     */
unsigned int  rsh_frimg;    /* Offset to free image index
     */
unsigned int  rsh_trindex;  /* Offset to tree index     */
unsigned int  rsh_nobs;/* Number of objects        */
unsigned int  rsh_ntree;    /* Number object trees      */
unsigned int  rsh_nted;/* Number of tedinfo structs    */
unsigned int  rsh_nib;  /* Number of iconblk structs    */
unsigned int  rsh_nbb;  /* Number of bitblk structs */
unsigned int  rsh_nstring;  /* Number of free strings   */
unsigned int  rsh_nimages;  /* Number of free images    */
unsigned int  rsh_rssize;   /* total bytes in resource  */
} RSHDR;
```

I don't have the extended rsc-file format to hand. :-|

>I anyone knows how to do this from GFA I would be even
>happier! :)

Both 'int' and 'unsigned int' above are 16 bit values, so you could
Fopen(),Fseek(),Fread() on the rsc-file.

It wasn't. If I didn't run Thing it worked fine, if I ran Thing *all*
applications would fail the same way.

Yes, iirc the whole system is valid except for (of course) the Gem parts, AES,VDI,GDOS. LineA is up also - for the console and (again iirc) a mouse can be brought into life via the LineA without too much work (probably needs sprite and handler).

>And also: can GEMDOS be used in the boot sector? for file i/o?

If by that you mean Rwabs(), GetBpb() etc then yes.

Oh, one side-issue that may be relevent if you're planning a TSR: file accesses that add to the "40 folder bug" will persist for the life of the system (so scanning the whole hard disk structure with FsFirst/Fsnext is bad news). If the auto folder prog quits then it isn't an issue (provided the bug never "triggers") because it all gets handed back on process termination.

Actually, the VDI is available as well, but you have to open the physical
workstation yourself. I don't know about GDOS. I wouldn't recommend using
LineA, most graphics-cards doesn't support it.

Well, it sounds you're victim to the Psetlimit()-bug in Geneva without
MiNT. Read http://www.deja.com/=dnc/getdoc.xp?AN=483949820 for details
and how to patch Thing to make this problem go away - but with losing
the ability to limit memory on installed applcations.

Ciao

Thomas

Hi Joakim,

If you just want your ST to play a sine wave, I'd tend towards using the onboard sound chip rather than the DMA sound. To play a sinewave through DMA sound, you'd first need a sample of a sine wave, whereas (I think!) the Yamaha PSG chip will play one for you. Have a look around the net for documentation on the sound chip.

Hello,

> If you just want your ST to play a sine wave, I'd tend towards using the onboard sound chip rather than the DMA sound.

The method I use ATM is the SOUND command (which I believe uses the sound chip) in GFA-basic, but people have reported that this causes problems with MagiC-Mac and have requested support for DMA-sound instead.

The program I am writing is a hear trainer (hEARCoach), and the sound thus represents notes. Originally I only intended to have support for MIDI-devices but it turned out that many users without MIDI-equipment was interested in such a program. Therefore I decided to add some basic sound support.

My idea was then that a sine simple would not be impossible to create directly in memory.

Best regards,

Joakim

If the resource file is already loaded, it may be simpler to use
something like this:

```
treecount()
{
        int     count;
        OBJECT  *tree;

        for(i=0;TRUE;i++)
        {
                rsrc_gaddr(R_TREE,i,&tree);
                if(tree==NULL)
                        break;
        }
        return(i++);
}
```

If you create it, it won't be a sample. ;-)

Anyway, most programming languages that support floating point numbers
have trigonometric functions. Surely GFA Basic must have SIN()?

Then it's just a matter of calculating a proper step value for the
frequency you want and build a table for values from 0->PI (most trig
functions expect their parameter in radians). Then invert those numbers
to get the PI->2PI interval and copy as many times as you want
(depending on how much RAM you are prepared to use (you'll have to reset
the DMA address more often for a shorter waveform)).
Naturally, you can build more of the table using SIN() directly, but
those functions aren't very fast and there isn't any point, anyway.

The values you get from SIN() will be in the [-1,1] range, so you'll
have to scale them to the 8 bit integers used by the DMA sound.

   Well I really meant GEMDOS. Can I do F* GEMDOS-calls?

   Thanks to you and Jo for your answers.

   My AUTO-program aims at doing some (Falcon) resolution changes.
There is a problem though: IIRC the resolution change is effectively
done only when the amount of memory taken by the new screen is lower
that the one of the current system-screen (otherwise it hangs). That's
why I thought it was a memory-allocation problem.

   I have let VSetScreen handle this, but it seems it's not the right
way to do it... Should I use VSetMode, VGetSize and Malloc instead? But
this way I think I'll lose the memory allocated for the first screen by
the system, which is really annoying as my program deals with launching
memory-hungry programs (demos/games)... Or does anyone know how to use
Srealloc (which I think allows reallocating the screen memory)?
BTW I am also looking for the calling procedure of the other unofficial
XBIOS function that allows VIDEL registers loading & saving...

   Not relevant here but nice to know anyway (for future bugs...).

   Anyone has remembering of an undocumented feature of TOS which
allows (sort of) "short resident routines" put before GEM starts in the
memory between the end of system variables and the start of the OS to
be kept there and executed in some way (if they had some sort of code
checksum value or marker)?
   I know it is very vague but I have already read this in some doc I
cannot remember either its name or location. Any clues?

It's undocumented, but the bios will look at each 512 byte block in memory. If a block starts with the long $12123456, followed by a pointer to the current 512 byte block and the checksum of all the bytes in the block is $5678 - the bios will execute the code in the block.

Of course, as the Falcon's Video RAM needs aren't fixed. Best way is to Srealloc() the amount of bytes returned by VGetSize, and then use VSetScreen with the address returned by Srealloc() for the physical and logical screen address (provided it was non-null, otherwise an error occured).

Ciao

Thomas

Lost the original post, but here is the small bit of code in GFA to fetch the total trees.

total_trees%=CARD{LONG{LONG{GB+4}+14}+22}

That's in, one line, not file access, loops or condition checks. Just make sure that you indeed have called RSRC_LOAD() before uning this bit if code.

>checksum value or marker)?

If I understand what you meant, you're describing the way TOS searches for reset resident programs between _phystop and the end of the system variables ($0600). If this is the case, then here's some pseudo code of how TOS finds this type of reset resident program.

```
address = contents of _phystop
while (address > 0x600)
{
  address = address - 0x0400
  if( contents of address == 0x12123456)
    if( contents of address+4 == address)
      if( (sum of words at address to address+510) == 0x5678)
        execute code at address+8
}
```

IIRC this type of program is executed after bootsectors are checked and, if required, executed.

As a small example, here's a small program that sets up a reset resident program. I've added some comments (which is rare for me ;) to try and show how it works.

```
; start of code

_phystop        equ     $42e

start
        clr.l   -(sp)           ; into supervisor mode
        move    #$20,-(sp)
        trap    #1
        addq.l  #6,sp
        move.l  _phystop,a5     ; get end of physical RAM
        move.l  d0,-(sp)
        move    #$20,-(sp)
        trap    #1
        addq.l  #6,sp

set_up
        sub.l   #$8400,a5       ; _phystop-33k bytes (puts it below the
screen memory)
        move.l  a5,a1           ; use A1 as temp address pointer
        move.l  #$12123456,(a1)+        ; here's the flag
        move.l  a5,(a1)+        ; and the address of the block
        lea     reset_prg(pc),a0
        move    #(end-reset_prg)/2,d0

.loop1
        move    (a0)+,(a1)+
        dbra    d0,.loop1

calc_checksum
        move.l  a5,a0
```

```
        clr     d0              ; clear D0 for checksum calculation
        move    #$fe,d1         ; 255 words ($00 to $fe)

.loop2
        add     (a0)+,d0
        dbra    d1,.loop2

        move    #$5678,d1       ; the value required
        sub     d0,d1           ; subtract checksum from required value.
        move    d1,(a0)         ; and store at the end of the block

exit
        clr.l   -(sp)
        trap    #1

; this is the resident code. It must be less than 502 bytes to fit in
; one block. If the code won't fit, a 'bra.s' can be used to jump over
; the checksum word.
reset_prg
        pea     prg(pc)         ; use PC relative code so it can be
        move.w  #$9,-(sp)       ; so it can start at any address
        trap    #1
        addq.l  #6,sp
        rts
        even
prg
        dc.b    'If you see this line, my reset '
        dc.b    'resident program was executed'
        dc.b    13,10
        dc.b    0
        even

end     equ     *

; end of code
```

I doubt LineA is "unsupported" as it appears (GDOS for instance,
plonks itself into the LineA font ring). No matter, I agree using
LineA when there is any other alternative is just making trouble for
yourself.

I thought about it for a while, then a a longer while, and now a whole
week has gone by! Tbh I can't think of any reason to replace the ST in
the first place. It'll be running long after the PC that replaces it
has expired, and even if it doesn't there are still plenty of ST's
about to replace a busted one.

Finally, if ever the software wanted upgrading, unless you've got the
sources for the ST app then it'll have to be written from scratch or
replaced with a PC app anyway.

> while (address > 0x600)
                 ^

Just a small correction: That should be a >=, not a >.

```
>   address = address - 0x0400
                            ^
```

And another one: That should be a 0x0200, not a 0x0400.

> As a small example, here's a small program that sets up a reset resident
> program. I've added some comments (which is rare for me ;) to try and
> show how it works.
> [Source code snipped]

Substracting a fixed value from _phystop and assuming it's no longer screen memory is likely to fail on machines like the Falcon. A better way is to use Malloc() to allocate 1024 bytes, align the addres returned to a 512-byte-boundary, and then use Ptermres() on exit (if you're not planning to trigger a reset right away).

Ciao

Thomas

Okay, here's what you do: Go out and buy a midi-tower PC

case. Remove the Atari 1040 ST motherboard and put it in the
PC case. Now, tell your boss it's a PC--and run the same old
software on it that has been working all along.

That would be a much better way of doing things. You can almost tell the
code was developed with an ST in mind. I found a description of this in
an old ST World (January 1989 for the curious) and I made sure the
example code worked on the ST before posting it. Not having a Falcon,
any extra memory used by the screen wasn't taken into account.

It seems to be in the versions of TOS I've seen (TOS 1.00 and 1.62)
and it's in Magic 5.11 so I'd guess it's in all TOS versions.

Hello,

I have a MEGA STE and the hard disk inside don't works fine but it is
recognised !!

Thus i trying to install an other SCSI disk MAXTOR LXT213SY (200Mo) and the
MEGA STE don't recognize it with the HDX.PRG and HDINSTALL.PRG utilities.

How can i do ?
Is there a special disk for MEGA STE ? (i don't think because the interface
is SCSI)

HELP HELP HELP !!!

best regards, David

Well, even with my "solution" there's no guarantee the memory address
returned my Malloc() isn't located too close to the current screen
memory - but it's not very likely.

Ciao

Thomas

I'm looking for the structure of the "physical interface"
drivers for MetaDos (.BOS files)

I'm also looking for all docs about
ATA and ATAPI
ISO9660 and Joliet CD formats

Please help !

Hi,

Im trying to get MiNT up and running on a Falcon and
wondered what the best current (English if possible)
distribution is. Ive tried MultiTOS and various magazine
disk versions (!) in the past, but found it tricky to get
working.

Regards

Bob.

  Bob, grab K. Ellis's "KEMD Revision 2" archive from:

  http://kellis.atari.org

  Read the accompanying docs very carefully, send E-mail
  to me or post here if/when you need help. ;-)

  Catch ya later!

Hello to all interested in getting inexpensive, but current software.
Have over 1000 different programs of all kinds. Below is a small list of programs, just to see how inexpensive they are. Have graphic sofware, 3D Building sofware, Architecture software, Programming software, etc.
For the list, and any question YOU MAY HAVE , please e-mail.

- Adobe Illustrator 8.0 = 20$
- Adobe Pagemaker 6.5 = 18$
- Adobe Photodelux = 18$
- Adobe photoshop 5 = 20$
- Adobe Premiere 5.0 = 18$
- Corel Draw 9 = 20$
- Corel Photos: Professional 5000 photos = 15$
- Corel Xara 2.0 = 20$
- Macromedia Authorware = 18$
- AutoCAD 14 = 20$
- ArchiCAD 6.0, ACAD 14.5 = 22$
- architectCAD = 18$
- Arhicad 6.0 = 20$
- AutoCAD 15 (AutoCad 2000) = 25$
- MathCAD 9 Professional = 25$;
- Borlad Delphi 3.02 = 18$;
- Borland C++ 5.02 = 20$
- Borland C++ Bilder = 25$
- Borland Delphi 4.0 (4.2) + libraries = 20$
- C++ Builder 3.0 Borland = 20$
- Cd-recorders = 20$
- Linux 5.0 = 18$
- LINUX OFFICE '98 = 20$
- Linux Red Hat 5.1 = 20$
- Mathlab 5.2 = 20$
- Microsoft Office 2000 = 25$

  and others !!!!!!!!!!!

These CD's are not copies, with all pictures, tools and everything.
E-mail me if interested. And if you buy several CD's, the price will
be less.

When you reply me, please, tell me the kind of programs in which you are interested.

I also have a lot of games.

Thank you.
Vlad

:Regards
:Bob.
:
A pretty easy way to install MiNT is to use TAF's 7 DD

floppy disk set, available at fine ftp sites everywhere.
However,
(there's always a 'however' isn't there?)
this installs Xwindows, and an old MiNTnet,you will have
to start replacing old files with newer ones. Mind you,
you have to do that also with the KGMD(KEMD with kellis's
translation) as it is an old distribution.
Martin-Eric Racine (see his TT pages) is working on a
new installation program(NMD), and there is also the CD
MiNT distribution (MiNT'99) from Whiteline, with an
installation program. good price I think.
this should get you going! :-)

Are you going to produce the 'Atarian' using MiNT? <grin>

:> if there is one available for purchasing, where I could get it.
: AFAIK there are no more to purchase...

I think HiSoft is still selling Devpack??

:> want to do some graphics programming and see how fast I can get this
:> beast to run in 3d. Which reminds me, I guess I would somehow need
: Calm down guy, the "beast" has only a 8MHz 68000... so don't expect
:too much from it...

nicely said! :-)

:> to find information on the graphic card (video modes, software
:> interrupts, etc.) so i could do graphics programming. Anyways peace
:Video modes :
: - basic ones available: 320x200x16c(colors, not bits) or 640x200x4c or

:640x400x2c (monochrom B&W, this one needs a special monitor whereas the
:two others works on a TV or standard monitor)

you can get a S/VGA adaptor which allows you to use a SVGA or VGA monitor
for monochrome with the ST from Mario Becroft.
Also Mario Becroft is working on a VME card/adaptor which will give you
1280x1024 in 16bit (65,000) colurs.not much good for an ST, but he's working
on that also!:-)

: - AFAIR you can extend it by various software dirty incompatible time-
:consuming tricks up to 448x272x16 (max I think, very tricky, needs half
:processor power to sustain it... and lots more to fill it with
:pixels...)
:Software interrupts:
:On Atari system, you do not need them for graphic programming (apart
:from color rasters :)...).
:
:> out, and any help is defintely appreciated.
:Hope this helps.

:Thanks!

hey.no problemo! (I think)

Check out Mario Becroft web site.
He makes a ST and STe IDE board for a good price.
I have a STe IDE board in my STe (~60ukp)
a 120 MB IDE 2.5" notebook drive (~20ukp)my cost-Toronto
with a 2.5" IDE cable (~5ukp)my cost-Mario Becroft
PLUS
I get TOS 2.06!
I think Chris Crosskey is the dealer in the UK.
but I can't speak for his prices, I don't know them.
He is a good head though, fast and reliable AFAIK
check mario's web site for his address

Hi All,

I have recently installed GCC v2.7.2 onto my Hades KGMD setup.
This works just fine and I can write and compile C++ programs
without any problems.

I would really like to write GEM applications in C++ so I have
been trying to install the GEM++ class libraries to help me do
this, but I have been having a few problems.

One of the compilation errors I have been receiving is a cannot
find file error from the linker. It's looking for gemlib++.a (or
was it libgem++.a) which I do not have. I know that GEM++
needs either GEMLIB or MINTLIB to run which I thought I had
installed.

So, my question is, could anybody out there who programs using
the GNU C++ compiler and the GEM++ libraries please tell me
how to setup GCC, and GEM++ and let me know if there are any
other programs required in the setup so that I can at least
compile the example programs that come with GEM++.

Any help would be greatly appreciated.

Thanks.

Regards,

Ben Hills.

> Can anyone help me?

Depends on what kind of "dynamic variables" you mean. For variable sized arrays of arbitrary type elements, there's the function qsort(), the prototype should be in stdlib.h. qsort() implements - as the name suggests - the quicksort algorithm, which is (one of) the fastest general sorting method(s) currently known.

Ciao

Thomas

P.S.: I'm not absolutely sure whether the Pure C libraries contain this function, as it's POSIX, not ANSI.

Dont fear, it is in stdlib. The (original) Turbo C book claims it is ANSI.
It certainly is in the ISO standard C library, which thinks it is a copy of ANSI.
But who cares? A good reason for including a function in a library is because
it's USEFULL. ;-)

Beware: The sorted elements must be all the same size. If they are not, built a
array of pointers and sort them.

To use qsort() I have to build an array with pointers?
But I don't habe such array, and I don't want to have it.
It's like this:

```
typedef struct bla{
    char *....
    ....
    struct bla *next;
    struct bla *prev;
}
```

For example I have a base with about 10000 such structures and I want to sort
this 10000 structures.
Can I make it with qsort???

No, not directly. Either build a temporary array, then use qsort(), and then adapt all next and prev pointers. Or implement quicksort yourself, though the approach is quite fixed to be used on arrays.

How does your linked list get filled? Wouldn't it be better to switch to AVL trees? These are balanced binary trees (i.e. they have a root node, and each node has two leaf nodes, the left being less than its parent, the right greater or equal, and each branch is almost of the same height), and sorting/balancing is done at insertion time.

Ciao

Thomas

If all these 10000 bla's are in an array, you can. If not you must make one. qsort sorts arrays. Building a pointer array make's qsort extremely fast, because it needs only move the pointers around. It's a very good idee, whether you want it or not. :-)

Hi everybody,

My stupid question of the week: Is it possible to have a command line longer than 126 characters?

I wrote a tiny TTP that do nothing but catching the command line. Up to 126 characters, no problem.

Beyond 126 characters, we're supposed to use the ARGV protocol but it seems not to work the right way under MiNT/N.AES/Jinnee. Under plain TOS (3.06), a too long command line leads to bombs.

What I know about ARGV is that the command line length is set to 127 (that's what my TTP can read) and the content is (supposed to be) inserted before the environment string. But it never happens. My TTP reads the long word at basepage+44 which is a pointer to the environment string. Right? All right, I

got a pretty long environment string (because of MiNT) but the command line has

disappeared in the mean time! At the normal command line address (basepage+128), there is only the length byte (127 according to ARGV protocol) and nothing beyond (0, 0, 0, ...). The environment string is correct but there is no command line anymore, neither before, nor after the environment string. And I never find an "ARGV" string anywhere like I was supposed to.

So... What's wrong? Is it Jinnee's fault that poorly handles the command line? Is it definitively impossible to have a long command line? Or is it me that don't understand the ARGV protocol? Or is it once again one of these bl**dy MagiC-only things?

Last thing to say: I'm talking about GFA.

OK. Thanks.
I'll try to make it with qsort (I'll make an array with pointers).
Thanks very much.
During this week I'll see how it's working :))

Thanks

Hi!

Remi Villatel <maxilys@normandnet.fr> wrote:
> So... What's wrong? Is it Jinnee's fault that poorly handles the command line?
Well, AFAIR the TOSRUN mechanism found in N.AES 1.x doesn't correctly
handle ARGV, i.e. the TOSRUN manager already doesn't receive the ARGV
environment string, so that any TTP hasn't got a chance to evaluate it.

I'm not sure whether this is the correct reason, but at least one stage
before the actual TTP is run drops ARGV= - so it's not your fault. For a

test, just rename your .ttp to .app and let it print the environment. It
should then contain ARGV=.

Ciao

Thomas

Remi Villatel a ©crit :
Hello Remi

You can find explanation in French on my page:
http://www.utbm.fr/les.personnes/olivier.landemarre/argument.htm

Long ARGV don't supposed the system you use, it depend only of the the startup of
your
compiler. For GCC no problem, I think for PureC, Lattice too. For other I don't
know and
perhaps it need to change the startup.

Donc en francais peut etre un peu plus correct que mon anglais, les arguments

longs
tels qu'ils
ont ete definis officiellement (et qui est une rustine au probleme!), specifie que
au dela de 125
il faut passer l'argument en environnement avec ARGV=..... C'est le header du
programme
qui se charge de faire la popote! pour le transmettre au main(). Heureusement que
l'environnement
n'etait pas limite! Cela marche tres bien et je te conseil d'aller lire ce que
j'ai
ecrit la dessus (cf adresse
plus haut). Comme tu semble utiliser GFA je ne sais pas si ca marche il faut que
le
code de demarrage
le supporte. Si ce n'est pas le cas ca serait bien un monde qu'il n'y ai pas
quelque part un patch.
Aussi le code de demarrage bien fait retourne le ARGV dans la commande standard
(qui n'est en fait
pas limite a la reception et l'elimine de l'environnement)

I don't know, but to add to your question...

Are the complete compiler sources available, and where?

[then I may have an answer for you] :-)

If anyone has installed Linux on a Falcon030 I could use your guidance.

I am looking for HowTos and FAQ's/Walkthroughs on installing and make a
stable build of Linux on a Falcon030

Thanks in Advance

Organization: SBC Internet Services
NNTP-Posting-Date: Fri, 17 Sep 1999 18:43:44 PDT
Newsgroups: comp.sys.atari.programmer

Greetings,

I began playing a MU* about two years ago, after playing pen/paper games for years. With the right group of people, a real magic can arise between the players. Everywhere I have looked for something similar, I have found tired echoes of that magic. It's time there was a really mythic, literate, serious, joyful, fantasy roleplaying game. Something intricate enough to keep people fascinated, and give them a place to really -explore- the possibilities of text-based online role playing.

We want to create a place like that; a place that is magical, and intricate, and fascinating. A place that doesn't grow old, but grows. A place where people can interact with the mythical fantasy world in a way that's rewarding and fun.

We are seeking creative, inspired programmers to help us in the creation of a text-based MUD environment. We have been at work on this project for about a year and a half, and have a stable development environmnet running on an Intel linux box. Coding can be done on a home PC, but having

knowledge and access to Linux is preferred, and our server can be used by all team members.

(A mud is a text-based, self-running adventure system, based on a database and rules of interaction - telnetable, where people create characters and interact with each other and the virtual environment. A good working knowledge of C is required, a sense of teamwork, and the ability to work a minimum of about 2 hrs/week on the project.)

Our Platform:

We have an always up server, a majordomo, running on Red Hat Linux (intel). We use a DCS code tracking system and have a good organizational structure within the project, meaning there is web based record-keeping and things are kept closely updated within it, creating a resource for our coders. Mordor is a fairly primitive codebase, familiarity with C is a must.

Our Goals:
We want to create an inspired and inspiring team that will allow us to grow a fantasy-based role-playing environment that is rich, rewarding, and fun to be a part of.

If you're looking to join a team with some interesting goals, and help us create a great text-based mud, please send me some info on yourself, what you're looking for, etc and we'll quickly set up some time to chat.

Remove asterisks to reply...

Thanks!

Really it dont matter.

What I would like to do is use the Falcon to run Linux and Linux apps
(ie ftp services, mail, www, net scape, etc)

And maybe Wine (Windows emulation under Linux, said to be faster then
Windows itself)

I use AIX 3.2 on an IBM Risc machine at work, so I am fairly familure
with Unix, and to keep my Falcon Alive I just thing that Linux would be
cool to have on there.

Thanks

Wine Is Not an Emulator. (hence WINE) Unless something has changed very
recently it will only work on x86 machines, which rules out the Falcon.

Well, I have not installed Linux on a Falcon, but I am in the process
of installing it on my Hades, so the process should be the same.

Although there is now an unofficial port of Red Hat to the M68K
platform there are currently no installation utilities for the
Atari so your best bet would be to install the Debian distribution.

You will find information on installing Debian on the Atari platform
on their WEB site. http://www.debian.org

You will also find a list of suppliers on their WEB site so you
shouldn't have any problems getting hold of a copy. You could also
look at the Whiteline Linux CD's which are basically Debian.

http://www.atari-world.com

Hope this helps.

Regards,

Ben Hills.

Greetings all,

As usually you can probably guess by the subject line what I am looking
for here. I want a way to look if MIDI-hardware is present, but that at
the same time DOES NOT lock up the computer if no MIDI-hardware is
found. It wouldn﹏t be to much use else, eh?

Another question, that I recently posted here but got no response to,
is if there is a known way to playback sounds (notes) that will work on
both original Ataris as well as emulators like MagiC-Mac/PC and such?

And also, is it possible to whether or not a system has ST-compatible
sound?

/Joakim

Greetings all,

I wonder if there is any reason why using copy raster (vdi-function 109)
wouldn't work with MagiC-Mac? (The routines I use are taken
from ictari-10 if somebody still got these lying around somewhere)

I use this function to enable fast redraws in a program I have been
working on for a while now, and have been told that my blit-redraws
won't work at all with MagiC-Mac.

This sounds very strange to me, as I myself have verified that
everything is alright with geneva, n.aes, MagiC and MagiC-PC. Is there
something special about MagiC-Mac that can cause problems like this?

I would really, really appreciate help on this one!

Ok, all for now!
Have a nice summer,

/Joakim

I know for a fact that vro_cpyfm() works on my Mac at work under the
MagiCMac demo, since I've run MGIF in quick VDI mode just fine.
This is in 256 colours, though.

>I use this function to enable fast redraws in a program I have been

Depending on what you mean by 'redraws', blitting may not be the way
to go on machines with graphics acceleration.

It can be very slow to copy data from the screen to RAM and back again,
while normal drawing operations can be fast as lightning.
(fVDI/mach64 does it's best to optimize such things, though, by actually
 not doing the copy to normal RAM. Instead it uses free internal memory
 on the card. I'm not aware of any other VDI that does this, however.)
If you're rather talking about creating a complex image of some kind in
RAM (such as for a game, perhaps), there isn't much choice, obviously,
but at least you won't need to blit from the screen.

>working on for a while now, and have been told that my blit-redraws
>won't work at all with MagiC-Mac.

I assume you are aware of the usual problems with true colour graphics
modes using vro_cpyfm()? That is, the bit order may differ from card
to card and the only thing you can do with the normal VDI (NVDI and
fVDI have a special function) is to set test pixels, blit them into
normal RAM and see how they look (there's a nice library out there
somewhere that will do all this for you, but I can't recall the name).

Do not assume that you can access the screen directly in any way.
The screen address you can get from the Xbios may not necessarily
have anything to do with the one the VDI uses (with a graphics card,
the screen may not have an addressable frame buffer at all).

>This sounds very strange to me, as I myself have verified that
>everything is alright with geneva, n.aes, MagiC and MagiC-PC. Is there
>something special about MagiC-Mac that can cause problems like this?

The main difference between MagiCMac and the rest you mention is that
the others have an original Atari screen mode or emulate one.

Ok this is how it is done:

Before opening a window I reserve memory through MALLOC for the
blit-image. I have restricted colour-depth to a maximum of 16, since I
believe the first 16 are supposed to never change due to being system
colours. (Unless restricted in this way, huge amounts of memory will be
reserved on setups with great colour resolutions.) Right/wrong?

Objects will be redrawed for the first time with a standard OBJC_DRAW.
As soon as it is written, a copy of this is placed by the VDI-function
in the previously reserved memory. After this, all redraws will use the
VDI-function to restore areas when needed.

Is this a bad way to do things? I know for a fact that using OBJC_DRAW
all the way is fast enough on newer machines, but on older computers I
feel that the blitting really makes a difference that makes it worth it.
And furthermore, I have worked a lot with these routines, and I would
hate to have to drop them at this point. Especially as it seems to work
so well on everything but MagiC-Mac.

> I assume you are aware of the usual problems with true colour graphics

Ok, but the first 16 should be the same, right?

Which calls will be affected by this, and in what way?

Sorry if some questions seems to be to simple or silly, but since I
don't have a clue to these things the only way to find out is to ask. :)

Regards,

Joakim

If it works ok on all the actual Atari models then is there really
a problem? Send ASH and bug report about magic-mac.

How do you do that? Restrict the colour depth, I mean?
I don't think I understand what you mean here.

>believe the first 16 are supposed to never change due to being system

The actual colours shown should normally be the same, but the pixels

will look very different in the frame buffer if you compare for example
the normal Atari 4 bit mode and a graphics card 16 bit mode.

>colours. (Unless restricted in this way, huge amounts of memory will be
>reserved on setups with great colour resolutions.) Right/wrong?

I don't see how you intend to get around reserving that huge amount
of memory.

>Objects will be redrawed for the first time with a standard OBJC_DRAW.

OK. On a system with a graphics accelerator, your blitting is quite
likely to be slower, but it depends on what you're drawing and how much
you need to blit.

In a 16 bit mode you'll need to blit (and of course allocate memory for)
two bytes per pixel. An 8 bit mode would be one byte per pixel and a
24 bit mode three or four bytes (such modes are often really 32 bit)
per pixel.

>Is this a bad way to do things? I know for a fact that using OBJC_DRAW
>all the way is fast enough on newer machines, but on older computers I

It should be relatively easy to do redraws instead of blits only in
graphics modes with 'large' pixels.
You could also do a small test to figure out if the machine is 'fast enough'.

>And furthermore, I have worked a lot with these routines, and I would
>hate to have to drop them at this point. Especially as it seems to work
>so well on everything but MagiC-Mac.

vro_cpyfm() really must work under MagiC-Mac, but perhaps some of your
code uses it in the wrong way. Your comments earlier about only using
a few colours points in that direction.

Have you tried your program in for example FalconTC, or on an Atari
with a colour graphics card of some kind?

>> I assume you are aware of the usual problems with true colour graphics
>> modes using vro_cpyfm()? That is, the bit order may differ from card
>
>Ok, but the first 16 should be the same, right?

The colours, yes, but not their actual representation.

>> The main difference between MagiCMac and the rest you mention is that
>> the others have an original Atari screen mode or emulate one.
>
>Which calls will be affected by this, and in what way?

The VDI should really insulate you from this, if you use it correctly.
That isn't entirely simple (an understatement) when dealing with colour
images in true colour modes, though.

If you never need to touch the things you blit from the screen, and
don't intend to display any colour images (as opposed to drawing things
with lines etc), you don't have to worry about any of this. The VDI will
take care of everything.
Naturally, you need to supply large enough buffers for the blits, though.

The only Atari machine that has a graphics mode that could cause the
same kind of problem (if I understand the original poster correctly)
is the Falcon, with its 16 bit true colour mode (well, if its only
a matter of the buffer size, the Falcon or TT 8 bit modes might also
cause problems).

Even testing there doesn't necessarily mean that the code is correctly
written to deal with any graphics card, though.

>a problem? Send ASH and bug report about magic-mac.

This isn't very likely to be a bug in MagiC-Mac. It probably only has
to do with the graphics mode used there and could be fixed with proper
coding.

Vro_cpyfm does work on MagiCmac. I use it for screen redraws in a scoring package I wrote for the Atari and that package runs without a hitch on my PowerMac at work under MagiCMac. Maybe someone was thinking of the actual blitter chip when they said that blits wouldn't work on the Mac?

I guess if fVDI had a function for allocating this memory on the GFX card

instead of using "system" memory this would be _very_ fast on a graphics card
as well. So maybe it's time for you to make this call availabl, Johan? Then
it's just a matter of checking the cookie for fVDI and then use a malloc
provided by fVDI instead and off we go. :-)

Such a function is coming in some form, but since very few applications
would ever use it, I do my best to automate these things instead.

In the Eclipse/mach64 driver, the AES background buffering (menus etc)
is already covered and that doesn't seem to cause problems for any
programs. I've also made it possible for screen->RAM blits of ordinary
applications to be done locally on the card, on the assumption that such
a blit will always be followed (soon) by one (might be extended in the
future) RAM->screen blit of the same area, and that the application
didn't really need access to the actual data.

I've not yet run into any application that actually uses the screen data for any other purpose than to blit it back (except for the special case of programs that write test pixels to the screen and then blit the data back to figure out how to deal with a specific graphics mode (often done by programs that can display images in true colour graphics modes), but fVDI recognizes all variants I've run across of that and handles them in another way), but two (plus the one we're talking about here, it seems) 'reblits' the blitted area several times.

Naturally, none of this caching or memory allocation can be done if there's not enough memory free on the card.

Hmmm, it's a long time since I did that kind of programming -- but I thought that vro_xxx needs the same number planes for both source and destination...

The first thing to check is how the MFDB for the screen is filled. It
is wrong to use XBIOS to find any values here -- just set the screen
address to 0 and let VDI worry about the rest..

I don't know if this helps, but using vro_cpyfm on MagiC-PC, everything
is OK up to 8 planes (256 colors) but draws black backgrounds at >=32k
colors! Checking the HTML docs (hmm, they're in German) it says to
use mode 5 (D_ONLY) with graphic cards, which is rather wrong, it worked
for me with mode 15 (ALL_BLACK) so I have again good white (!)
backgrounds in list windows.

Library used is the good old E_GEM 2.20, function "rs_sc_copy" which
calls "vro_cpyfm (_rc_handle, mode, pxy, screen, screen);"

What is the point of the INDIRECT ob_flag?

From the way it is documented, the ob_spec is treated as a pointer to the
real ob_spec.

Why would one want to do this?

hi, i have some trouble with printing from e.g. papyrus7, or pixart4.5.
normal ascii-text from editors are no problem, but on images, or TTF
i'm not sure if just the APP is wrongly configured, or if i need some
additional drivers for the milan !?

any ideas ?

1:
Objects that have the same specification can point to a single variable.
2:
If you want more information (probably your own) in a object, you can let
the ob_spec point to a structure of which the first element contains the
original ob_spec and the remainder your private information.

Henk.

Well, I haven't programmed the ST in a long while (Like, 6 years. I'm just getting back into it with emulation), but I remember it being useful for things such as changing icons on the fly (By changing where the bitmap object pointed to, and forcing the whole thing to redraw), or to save space when you have dialogs that look alike (You can have the part that looks the same points indirectly to the part that changes, and modify the pointer based on which one you want to show)

But that was a long time ago... I do remember it being extremely useful at times... Probably will be useless to you 99% of the time, but someday you'll be happy it's there :)

Patrick.

It might depend on the device driver which blit modes are available,
but generally I think they all would be. Their effect may not be quite
what you expect, though, since graphics cards usually aren't using
Atari style bit planes.

>for me with mode 15 (ALL_BLACK) so I have again good white (!)
>backgrounds in list windows.

I see what you mean now, but _please_ don't do that!

Mode 15 has never meant ALL_BLACK. It means all 1's, which in turn
happens to show the colour with highest index in paletted modes, ie
normally black.
In true colour modes, the maximum possible number is usually white
(max intensity red, green and blue)...

Why don't you use one of the obvious functions, that is v_bar or
vr_recfl? That way you can actually choose what colour to use and
expect it to work on any graphics hardware whatsoever.

I don't know about the various other VDIs, but in the current fVDI
mach64 drivers I've actually made blit mode 0 write all 1's and
mode 15 all 0's because quite a few programs erroneously seemed to
rely on these being white and black, respectively.
Now, if your program does the opposite (which _is_ more correct,
but still not a good idea), it won't work as you want, and if I
change the blit modes back to the way they should be, the other
programs will look wrong instead...

Once again, _please_ don't use vro_cpyfm for something it wasn't
intended to do (that is, filling with a specific colour)!

Yes, and what is strange with NVDI is that although it treats 8 and up
bit planes as graphics card oriented (I mean the 256 color mode is NOT
TT or Falcon compatible) it fills an area with white in 256 colors mode
and with black from 32k colors or more. The call in both cases is the
same, ie "vro_cpyfm (handle, ALL_WHITE, pxy, screen, screen);" !

>>for me with mode 15 (ALL_BLACK) so I have again good white (!)
>>backgrounds in list windows.
>
>I see what you mean now, but _please_ don't do that!
>
Well, I did nothing ;-), it's E_GEM library that uses this call !
(and to be honest I have little experience using any VDI).

>Mode 15 has never meant ALL_BLACK. It means all 1's, which in turn
>happens to show the colour with highest index in paletted modes, ie

Fortunately E_GEM contains the sources, so I can change that. But
please note that the above call is used for clearing a part of a
window (normally during redraw) and I thought it's faster than any
other method (no clipping, pxy preparation etc). Is it so ?

>I don't know about the various other VDIs, but in the current fVDI

Not much to say, you know better! The only problem (?) I can see is
that on /* bit blt rules */ of Pure C's VDI.H it defines ALL_WHITE
as 0 and ALL_BLACK as 15. This is confusing, but now it's fine with
me, thanks to your explanation above.

>Now, if your program does the opposite (which _is_ more correct,
>but still not a good idea), it won't work as you want, and if I

Ok, I have no problem to adapt, but I have no idea how many users
are using the E_GEM lib (I know it's been used in Papyrus !)
The change needed in rc_sc_copy is simple of course and anyone can
do it (in file TOOL.C).

>Once again, _please_ don't use vro_cpyfm for something it wasn't
>intended to do (that is, filling with a specific colour)!
>
Tell it to Christian Grunenberg ;-)
My tests were made under MagiC-PC/NVDI and the graphics card is a
QDI V2200 AGP 5096Q (?!). Having followed your discussions with
Ronald (and others) I'm really interested in testing fVDI. I'll
do it soon and let you know the results.

Greetings all,

I wonder if someone has some example or source code (GFA prefered) that
describes how to call for newer fileselectors? (freedom, boxkite and
others)

Do all/some of them use the same calls?

Thanks in advance,

Joakim

Yes. They all basicly replace the AES call "fsel_input", in GFA: Fileselect.
Most of them implement the newer "fsel_exinput" as well (The one to which
you can pass a title line.)

You do not have to do anything special.

Henk.

Hi!

In article <37925D24.CE6316E5@cable.a2000.nl>,
     Henk Robbers <H.Robbers@cable.A2000.nl> writes:
> You do not have to do anything special.

... unless you want to support their special features, like selection of
multiple files, non-modal activation, etc. There are several different
procotols for that (Selectric, Freedom, Boxkite, MagiC-xfsl(), where
Boxkite also supports xfsl() now), so a simple answer how to support

these features is impossible.

However, as Boxkite also offers the MagiC xfsl()-interface (which is
based on additional AES calls, detectable using appl_getinfo()), it
might be a good idea to start with that.

Ciao

Thomas

In what way is the 256 colour mode not TT/Falcon compatible?

It will of course be using packed pixels (one byte per pixel rather than
the bitplanes used by Atari 1/2/4/8 bit modes), but that shouldn't cause
problems for anything but colour image display (and not even then for
reasonably well written programs).

If you're filling anything larger than a few pixels, the setup overhead
won't matter. It's even possible that the internal operation done will
be exactly the same in both cases.

>>mode 15 all 0's because quite a few programs erroneously seemed to
>>rely on these being white and black, respectively.
>>
>Not much to say, you know better! The only problem (?) I can see is

It certainly would have helped if the VDI had been documented better...

>that on /* bit blt rules */ of Pure C's VDI.H it defines ALL_WHITE
>as 0 and ALL_BLACK as 15. This is confusing, but now it's fine with

It certainly is.
Before there were Atari machines with true colour graphics modes, it
was (somewhat) true, though.

>Ok, I have no problem to adapt, but I have no idea how many users
>are using the E_GEM lib (I know it's been used in Papyrus !)

As long as everyone is using those modes in the same way, a VDI can
take care of it. Hopefully, anyone who thinks long enough to realize
the differences between paletted and true colour modes will not use
those blit types at all. ;-)

>QDI V2200 AGP 5096Q (?!). Having followed your discussions with
>Ronald (and others) I'm really interested in testing fVDI. I'll
>do it soon and let you know the results.

Thanks.
I hope to get a final v0.94 released soon.

Yup... Try running older E-Gem apps (like the otherwise excellent LZH-
Shell) in truecolour :-(

Q... If you redirect an interrupt{ in this case, from the midi port}, and the
handler has to operate in sytem mode, what happens? Does the 68000 enter
interupts in system or the current mode? I ask because it means a lot of
program overhead if you have to switch modes before and after the routine.

All interrupts occur in Supervisor mode (you do not have to write code to
put the 68000 into supervisor mode in your own ISR routine).

The IRQ that services the midi ports does other things than just midi. On
your own ISR routine you can check the stack to see if the IRQ was caused by
a midi device, if not jump back to the original ISR vector.

Hi Jim!

C>Does the 68000 enter interupts in system or the current mode?
The 68000 always switches to supervisor mode if an interrupt occurs and
switches back when interrupt processing ends

Bye

Greetings all,

I hope I can explain this problem so you can fully understand what happens. I have experienced problems with GEM-redraws, when I want to redraw object trees that have a filling pattern included. It seems to me like if the background pattern does not move like all the other visual content of the tree, but instead lies like a "watermark". I have been looking for days at my redraw code, but I really can't find any bugs that can cause this. Since all other content (text strings, buttons, boxes and everything else) is placed correctly I wonder if this is a feature (bug) in GEM, or a problem with my program? It makes redraws look really ugly. I guess the only solution I can see right now is to redraw the WHOLE window, and not just the parts that has been previously covered. Right/wrong?

Please help me!

(If you think you CAN help, but understood nothing mentioned above, please contact me, and I can mail you my program, so you can see what I mean)

I'm not sure this will get posted as I have been having difficulties accessing deja.com lately, but I'll give it a try...

Best regards,

Joakim

[snipped clear and well recognized description].

The only thing you can do about this is:
Snap the horizontal movement of your window on the smallest common multiple of repetition sizes of all the patterns you use. I'll hope you know what I mean :-)
But 16 will always do.

That's indeed true for all pattern fills in GEM.
For some things it can be a real pain, but for others it's very nice.

>feature (bug) in GEM, or a problem with my program? It makes redraws
>look really ugly. I guess the only solution I can see right now is to

This should only be a problem if your tree has actually moved on the
screen, but I guess that's what you're talking about.

>redraw the WHOLE window, and not just the parts that has been previously
>covered. Right/wrong?

Aligning to some minimum safe number of pixels as suggested by another
answer will of course work, but may not be what you want.
Another solution is to have a user defined pattern and change it to
reflect the movement.

Hello.

I'm having problem with load and save options in my current project
(control theaterlighting with atari computer).

I'm using Gfa Flying dialogues, and when I'm trying to call the
FS_INPUT (and EX_FSINPUT) I must reserve at least 4 kb.
If I don't my TOS (both interpreter and compiled program) respones
that I don't have enough memory for this library.

I've earlier been adviced to stay away from reserve in GFA-basic,
since it's not working very well.

I would like to find another way to get the FS_INPUT working,
has anyone got some idea?

/Jeppe Br﹟nnmark

Hi Koos, I am working a bit on NOS and my system this summer, so here is question for you. Net2Net is GFA, so my system has to be resetted from time to time, or I've seen it's enough to close all programs and call an application in "single mode" to "reset" memory for N2N, I'm using MagiC with the MANAGER.

How can I make an event to start a program in "single mode" and/or one event to properly shutdown and restart the system once a day ? I've tryed different ways, but none is working at the moment, I'm doing something like:

```
#include <stdio.h>
#include <tos.h>
#include <stdlib.h>
#include <aes.h>

int main()
{
     char *cmdline, tail[2]={0};
     Pdomain(1);

/*   creat("u:\\etc\\fastboot");*/

     cmdline = getenv("SDMASTER");
puts(cmdline);
     if (cmdline != NULL)   shel_write(0, 1, 1, cmdline, tail);
OR->>
     shel_write( 4, 0, 0, NULL, NULL);
     shel_write( 4, 1, 0, NULL, NULL);

     return 0;
}
```

ideas ?

Again on the MagiC subject:

- how do I call a program in "Single Mode" ? I tryed the shel_write call with SHW_SINGLE but I get bombs, I think it works only for the shell (app_id=0), any way to call it from my program ? Can I make the shell to do it for me ? How ?

- how do I make MagiC close all opened applications ? I think to a program like shutdown but without closing the shell, should I make a loop finding all ap_ids>0 and send an AES message to close them ? How ?

- What are the current version and state_of_the art of MagiCMac and MagiCPC ? I think to leave off my TT and use my Quadra800 insted, but I am wandering about possible problems, first of all what's better, use HSF on the hard disk seen by MagiCMac or use an Atari formatted SCSI drive ? I think performance is better with the Atari partitioned disk, but it may be better to see the filesystem from the "mac world" also, and use those nice backup and repair disk/file utilities for the Apple thing....

- What about networking in MagiCMac and MagiCPC ? is all going well on the serial and parallel ports ?

- Is there a way to communicate to the "parent" OS ? I mean, in MagiCMac can I write programs that access the Mac resources, or at least can communicate with programs running in the Apple system ? How ?

Best to ask the university department what they use. Most standardise on C
but there are some who use Modula. Both of these are supported on the ST.

How do I write a function to tell the system (MagiC) to position the mouse
somewhere and do a click, exactly like it is done by a user input ? I would
like to automate some functions of programs I can't control from my C code.

The Phantom Menace told me that Paul Mac posted a message about What Language? to comp.sys.atari.programmer at 00:16:26, Tue, 3 Aug 1999:

>Hi ,
>
>I have limited programming experience , but hope to study it as part
>of my university degree.

With university, you're best off learning Pascal. I don't know it myself (I am now officially unable to learn another language.. After trying Java and C -- both failed) but apparently it's easy to learn and most programming houses look for people who know Pascal

>
>Of course most of this work will be done on a PeeCee but what Language
>would be best if I also wanted to use my new-found knowlege to do some tinkering
>on my ST?

Since Pascal is hard/impossible to get hold of for the Atari, you're best off learning either C or BASIC. I recommend you learn BASIC because it's the easiest one.

Greetings all,

As the subject indicates I wonder if anyone know if it possible to write
CPX-modules from within GFA-basic, and if so, is there any source code
available somewhere on ftps or other?

Thanks in advance,

Joakim

Take a look at appl_tplay(), but note that for a full /click/, you have
to play a press /and/ a release event.

Ciao

Thomas

Is there anybody who can suggest a good/experienced/skeleton/already
done/systematic way to "convert" a TOS program (printf, getch etc.) to a GEM
one ? I mean just avoiding the VT52.PRG in MagiC, opening a "text" GEM
window, send all text output in the window and catch keyboard input.

I think I should add:

appl_init
open the window

all printf etc., become print_in_window
getch etc. become evnt_keyb or evnt_multi (to handle the window itself)

close the window
appl_exit

No VDI, no graphics, should be simple, but what I want is an already made

source to "cut&paste" directly as I dot want to reinvent the thing.

iirc you are correct - only (app_id=0) can issue SHW_SINGLE. My memory
is vague after this amount of time so I'm not sure one way or the
other. However, it may be worth trying the SHW_CHAIN or whatever it is
called (equivilent to the only singletos option).

It might just work out that as your app quits, the shell invokes the
chained program, and if that is registered with it as being "Single
Mode" then ... well, fingers crossed it still runs single iyswim!

>- how do I make MagiC close all opened applications ? I think to a program

appl_search() and appl_find() - again iirc, this will allow you to
iterate the running applications. Send them a WM_QUIT and hope they
take notice.

Good question. I asked that about MagicPC ages ago and still haven't
got an answer.

Prospero Pascal, whilst old, is still very good. After all Pascal
never changes!

Well C is always a good bet, though if your ST is powerful enough you
might consider C++.

You could modify your click routines so that the app issues itself a
message saying what object got clicked. Then all you have to do is
issue those messages elsewhere and the app will be none the wiser.

Whilst I haven't used appl_tplay() under MagiC, I assume it works
because Thomas recommended it. Note though, that this call and its
counterpart appl_record() are buggy as hell under older Gem versions.

I'm sue I've seen PurePascal is still supported on ASH homepage, and
compatible with TurboPascal 7.0, this is really good for beginners, tought
people generally choose one of two ways: BASIC for simple approach accepting
limitations, C for hard coding and full control 8^)

Please allow me a question: why would you want to?

All the following is MHO, no flames please (though a good
discussion might help liven things up a bit around here).

Either your program is a text-mode application, or it is a GEM
application. You ought to decide which it should be.

There's nothing wrong with text-mode applications (.TOS and .TTP
programs) -- every operating system can handle them. TOS runs
them fullscreen, multi-tasking OSs such as MagiC open a window.
The user can configure that window's appearance, copy and paste
to and from it, etc. You can even use them from MiNT without
a GEM running, or in an X console window. You can easily port
them to any computer on Earth. All is well.

Now comes an application that is text-mode, but acts as if it's
GEM. It opens a window of its own (which looks different from
the console window that's opened for text-mode apps), but that's
as GEM as it gets. You still have to operate it by keyboard.
You need a GEM to run them on, and lose portability and
flexibility in the process. And you have nothing to gain for it.

That's my impression however. Either rewrite into real GEM
applications, or stick to text-mode. Don't create a "bastard".

Or alternatively, tell me (us) why you want to. :-) No offence
meant!

Yours,
Erik.

Anyone have any C code for translating a MFDB from 8 or less bit planes to 16 and up? I have code that kind of does this, but it doesn't display the colors properly and there must be someway to do this fairly quickly.

Any pointers etc.? I plan on releasing all the code to the project I'm working on when I distribute it, so if you don't want me to share your code, could you at least give me a few pointers as to what to try.

Thanks,

Dead easy:

```
  int dummy;

  form_button(object_tree,object_nr,1,&dummy);
```

No, appl_tplay() works OK (it's used in Maus-Window to move the mouse pointer and simulate a click when wind_get(WF_OWNER) isn't available) under all versions of (Atari-)GEM. It's just appl_trecord() that has some problems, so that you can't easily use a combination of record and play to repeat a sequence of actions.

Ciao

Thomas

Hello !

I'm "converting" an assembly source into GFA and I would like to know how putting a routine in Timer B using GFA ?

Here is a part of the original source :

```
    move.l    #timer_b,$120

timer_b:
    jsr       player+4
```

```
    bclr      #0,$FFFFFA0F
```

I've tried this in GFA, into a loop :

```
SLPOKE $120,player%+4
~BCLR($FFFFFFFA0F,0)
```

but it doesn't work...

Who can help me please ???

(for more info, it's the Sid Sound designer player source)

Thanks !!

What you're trying to do is clear bit 0 at address $FFFFFA0F but what
you are actually doing is clearing bit 0 of the value $FFFFFA0F.
Replacing the ~BCLR() with

```
SPOKE $FFFFFA0F,BCLR(PEEK($FFFFFA0F),0)
```

will get the value at $FFFFFA0F, clear bit 0 and write it back again.

Newsgroups: comp.sys.atari.programmer

Hello.
I'm currently woking on a project to control theatrelighting with the
Atari.

Sofar everything has worked out well exept multitasking.
So I've decided to make the program into smaller pieces.
My problem now is that I all the smaller programs need to
share one common memory address.
In this address there is supposed to be 120 bytes, that any
program can change at any time.

This is how I decided to build the program:

* Program init
* APPL_INIT
* Reserve 120 bytes (is there a really good way of doing this?)

* Open a file called EXPOSURE.QQQ in the root.
* Save a longword containing the address I got for the 120 bytes
  (how do you save a memoryaddress and how to do as a longword?)
* Close the file
* GEMDOS 49 (PTERMRES) quit and stay resident.

My problem is in the reservation of 120 bytes and saving of that
longword containing the address.

Would appriciate a fast answer!
Thanks

Ah, a Gem prog. That makes it a bit easier.

>* Reserve 120 bytes (is there a really good way of doing this?)

Any kind of dynamic memory allocation will do, so malloc/free in C or simply the OS one: Malloc/Free.

Alternatively, use a 'static' block declared within your program. From APPL_INIT am I correct in thinking you are using GFA and not C?

I don't know any GFA but what you want for 'static' is a GFA method whereby you can reserve a block of 120 bytes whose address will never change once the program has loaded.

>* Open a file called EXPOSURE.QQQ in the root.
>* Save a longword containing the address I got for the 120 bytes
> (how do you save a memoryaddress and how to do as a longword?)

Dunno for GFA but for C doing it via the 'static' way would go something like this...

```
static char common_block[120];

fp = fopen("EXPOSURE.QQQ","wb");
fwrite(common_block,sizeof(char*),1,fp);
fclose(fp);
```

The above saves the start address into the file. This'll only remain valid whilst the current program remains running of course.

>* Close the file
>* GEMDOS 49 (PTERMRES) quit and stay resident.

And this keeps it running, fine.

>My problem is in the reservation of 120 bytes and saving of that
>longword containing the address.

If all the programs are Gem ones (ie they use APPL_INIT) then you may consider using messages. The program that reserves the memory can send a message to all the others telling them the address of the block it has reserved.

Alternatively, with a slight adjustment you could have the "memory reserver" be a desktop accessory. This of course will automatically remain resident (you will have to use the 'static' method - malloc is problematic for DA's) and it can just sit there waiting for messages to be sent to *it*. Replacement Gem's make it even easier. Just launch multiple processes, one of which is the memory reserver.

Naturally one message it can expect is...

WM_WTF_IS_THAT_MEMORY :-))

... to which it will respond...

WM_ITS_ADDRESS_IS_IN_THIS_MESSAGE_HERE

Send messages via appl_write. Await them in the usual manner -
event_multi for instance.

Dunno, I've never done it. I've one thought (possibly useless)...

What about an in-place transform? Convert to the standard "portable"
VDI format where the planes are split one after the other, add some
more planes, then convert back to device dependant format.

The above is putting the address of the timer_b routine into memory
location $120.

```
>timer_b:
>    jsr       player+4
>    bclr      #0,$FFFFFA0F
>
>I've tried this in GFA, into a loop :
>SLPOKE $120,player%+4
```

As I don't use GFA I haven't the foggiest idea what that GFA statement
is attempting to do. Doesn't make sense whatever meaning I try and
give it.

```
>~BCLR($FFFFFFFA0F,0)
>
>but it doesn't work...
>
>Who can help me please ???
```

Such details are slipping from my mind over time - but are you sure
TimerB can be called from a language? What cpu register and stack
usage does it have? Put it this way, if it turns out to be impossible
to write TimerB routines in C then it will definately be impossible
with GFA, thus assembler may have to be used for the TimerB routine
itself.

On my web page you will find some source code for locating the
start address of a gfa procedure or function.

That might help?

in gfa it would be something like:

```
adr%=malloc(120)
if adr%<=0
  'some error!
endif
```

```
open "O",#1,"buffer.dat"
  out% #1,adr%
close #1

to get pointer back:
open "I",#1,"buffer.dat"
  adr%=inp%(#1)
close #1

to free ram later:
~mfree(adr%)

that is if you was refering to gfa  ;-)
```

Thank you, grazie, I'm starting to write now, and I do not want VT52 to
manage the text window, but simply change actual output to do writes on
program's own window. I want to use a library just to handle those nonmodal
dialogs and things that changes from normal TO to MagiC or other systems with
enhanced AES functions and so.

I do not know what those libraries do, so I will consider your opinion and
then get a recent release to have a look, thanks for suggestions.

Thanks Guy

I keep forgetting to check for crossposting, every now and then!

I wonder what the original poster meant by 'new on this group"! as they
seem to have newsgroup experience!!!!

```

This code does not work under MagiC6, atleast not on my TT... Btw., the wind_get-call should be "wind_get(win, WF_OWNER, &owner, &open, &below, &above)", but this doesn't help much either ;-)

Basically the problem is that while wind_get(0, WF_TOP...) returns the correct handle, the following wind_get-call only returns the same values every time (owner 1, open 0, below 11, above 1...). It also never returns FALSE, so the loop never ends.

I have a lot of small, but annoying problems like this with MagiC, especially the SM_M_MESSAGES to the screenmanager is giving me headaches. They *definitively* don't work as documented!

Hi!

In comp.sys.atari.programmer joska@nuts.edu wrote:
> This code does not work under MagiC6, atleast not on my TT...

Does Thing's topping of already running applications work? I.e., run a non-AV-Client (e.g. Pure C) open some windows in it, switch back to Thing and run the program again. Answer "No" to the question whether you want to run the app again, and it should get topped, including its menu bar.

If that works, the code is OK.

> Btw., the wind_get-call should be "wind_get(win, WF_OWNER, &owner,

Well, I wrote it from memory, so errors are to be expected ;)

It does in Thing, with MagiC 6.x on the Falcon, as with MagiC Milan (and N.AES, of course). Just a guess: You aren't using Pure C here? It doesn't work correctly for new wind_get/wind_set() opcodes, as it has an internal table telling how many parameters each opcode returns/expects. With new opcodes, the original PCGEMLIB code either crashes or does nonsense. You'll need your own wind_get() implementation, even for WF_TOP of you want to use its extended output.

If you're not using Pure C, I can't tell you what the problem could be.

> I have a lot of small, but annoying problems like this with MagiC,

At least the message to activate an app's menu bar does work correctly, Maus-Window successfully uses it.

Ciao

Thomas

Well that isn't hard have that bit done. Problem is coming in with the mapping of the colors properly in high resolutions. I can translate the images up, but then the colors are completely wrong.

Hi!

GH>but are you sure TimerB can be called from a language?
The important questions therefore (and for interrupts in general) are:
- How can I asure that no register is modified by the interrupt routine?
- How can I generate the rte instruction to finish the interrupt?

This is rather difficult to impossible (and compiler dependant) in C and I don't think it's possible in basic.

Another point you have to pay attention to is that you do not use any non reentrant code (function) which is used by your main program

IMO interrupts should only be programmed in assembler because it's the only language where you have full control over the generated code which is absolutely neccessary for interrupts

Hi Jo!

J>This code does not work under MagiC6, atleast not on my TT...
I have a programm that uses similar code and it works

J>Basically the problem is that while wind_get(0, WF_TOP...) returns the
J>correct handle, the following wind_get-call only returns the same
J>values every time
That sounds like the Pure-C wind_get() problem (which Thomas already explained)

J>I have a lot of small, but annoying problems like this with MagiC,
J>especially the SM_M_MESSAGES to the screenmanager is giving me
J>headaches. They *definitively* don't work as documented!
I am working on a small tool which provides the N.AES function appl_control() under MagiC. If that would fit your need: I am looking for beta testers which are able to use this function in an own program

Bye

That's it :-) I'm using the original GEM-bindings for this project, that's
the problem. Thanks for reminding me ;-)

My problem is that while it will hide an application without problems, it
might (or might not!) show a completely different application even when
I'm using the same apid... Or it will hide the wrong application and
display the correct one. Or get both wrong. Occasionally it will actually
get both right. And yes - I *am* checking the parameters :-/

Sounds like me :-) I'm using appl_control() in Taskbar under N.AES, it
would make things a lot easier if I could use it under MagiC as well.

> * Close the file
> * GEMDOS 49 (PTERMRES) quit and stay resident.

You can write a simple TSR-Program for the AUTO-Folder, which allocates the memory, writes the address of the memory in a cookie and terminates staying resident. All your little Programs can use the Cookie to get the adress of the memory. If the cookie doesn't exist,you can start the TSR-Program or quit your program with an error message. For this little TSR you must not use any AES call, since the AES are not initialized. In C your programm can look like

```
int main( void )
{
     void *memory=3DMxalloc(<amount>, <global>);
     =

     create_cookie('myID', memory);
     stay_resident();
}
```

but this work is done much better in an assembler program with less overh=
ead.

Greetings

Martin Els=E4sser

The only reasonable answer to your question is: Do it yourself!
(Or rather, find a library that does it for you.)

I've only done this the other way around (for fVDI), but what I do
there is at least compatible with the Falcon desktop.
Unfortunately, it seems like Atari couldn't decide on how vr_trnfm
was supposed to work in true colour modes. The Falcon desktop always
does a vr_trnfm, but it has specialized pre- and post-processing code
for the 16 bit case.

In short, 16 bit vr_trnfm is only supposed to combine the bits into
words (it's apparently up to the caller to make sure that those bits
somehow correspond to the correct colours), but 24/32 bit vr_trnfm
must also do a translation via the (software) 256 entry VDI palette to
give a valid colour value (I seem to recall that I had to reverse the
bit order too).
Then of course, the normal desktop can't display icons in any other

true colour mode than 16 bit in any case...
(It simply assumes that anything that isn't 16 bit can be treated as
 a palette based mode, which isn't very smart when it comes to masking
 the background in 24/32 bit. (To get any icons to display at all in
 32 bit mode, fVDI can be told to do all blits in D=S mode.))

If you want to see how fVDI does the reverse of what you're looking
for, just let me know. As I said earlier, you shouldn't go the
vr_trnfm way at all, though, for true colour modes.

I've been coding in x86 asm and c/c++. I just found this cool atari st in my closet but it has no software and only a floppy drive. I started playing around with tos for a bit. But anyways, I want to know if there is any freeware/shareware atari st assemblers or a c/c++ compiler for atari st. Or if there is one available for purchasing, where I could get it. I really want to do some graphics programming and see how fast I can get this beast to run in 3d. Which reminds me, I guess I would somehow need to find information on the graphic card (video modes, software interrupts, etc.) so i could do graphics programming. Anyways peace out, and any help is defintely appreciated.

I'm not certain I get your meaning here. What I have does work at least partially in all the tests I've done. I guess my sticking point is above. "It's apparently up to the caller to make sure that those bits somehow correspond to the correct colours". This is the part I'm stuck on. I'm used to the Falcon vr_trnfm bug. I can't remember exactly what it is at the moment, but basically clearing an mfdb on a falcon in 16 bit color doesn't work correctly (or at least something along those lines). I used to use a Falcon all the time, so had the routines fixed for that years ago.

The resulting bitmaps look correct except for the colours. So I guess what I am looking for is how to properly get these colors to appear on the screen. I thought I had someway to do it about 5-6 years ago, but I can't find the code anywhere and it's just been too long since I played around with those routines.

I imagine it's something fairly simple in effect. A matter of order in the definition of the colors. Of course I could be completely wrong on this.

Right now my process is in the following manner.

```
     save_current_screen_colors();

     uncompress_ximg_pallette();

     load_ximg_pallette();

     uncompress_ximg();

     vro_cpyfm_ximg to screen();

     free_temporary_decompression_for_ximg();

     ...

     restore_screen_colors();
```

I would have thought that this would have been the correct method since the vdi pens in 16bit color and up only apply to the drawing of pixels and don't actually change any colors already on the screen. However this doesn't seem to do the trick.

Do I have to manually go through the resulting image and redraw all the pixels into the correct colors?

Dan Ackerman
aka baldrick@netset.com

 RS> When you say single mode. Are you refering to when you set MagiC to
 RS> single tasking mode and run a program?

Yes, Thing desktop can execute programs in single mode, for example keeping SHIFT pressed.

 RS> Ahh with some programs it is best to let them close themselves down. For
 RS> example the program Manager by Koos Kuil actually uses a menu call to
 RS> shut down Semper. Forcing a program to shutdown usually means you have
 RS> to clear up after it all the resources it was using.

Yes but I want to auto-reboot my BBS each night to avoid freezing in the morning after some sessions/users.

 RS> Not sure about that one ... anyone?

I think it will be safer to use an HFS disk that I can see from MacOS, even if slower, and also easier to backup and repair.

 MDP>> - What about networking in MagiCMac and MagiCPC ? is all going well
 MDP>> on the serial and parallel ports ?
 RS> I know it is possible to network a PC and an ST with the Parralel ports.
 RS> I am not sure if the Mac has the same functions..

Nono, I was asking about using serial connections in MagiCMac and MagiCPC for STiNG, IConnect and so on, not to connect to a "real" Atari 8^) this is what I am doing now.

 RS> One thing that would be nice. Is if someone could create a networking
 RS> client for MagiC just like the Novell client..

My NOS can connect ppp or slip, that you access all tcp/ip world, actually I have a serial ppp connection to a win95 PC that acts as a router for the TT on my LAN.

 RS> Oooh thats a hard one. Anyone?

Yes I found myself some docs about MagiCMac and communications to the MacOS, you can do Mac calls from MagiCMac Atari programs and communicate with the MacOS, very interesting, tought a bit hard to build and test I think.

AREA [N.PROG]
In uno strano messaggio del 08 Aug 99 Steve Sweet (90:102/105) scrisse al
povero Mike De.Petris:
 MDP>> - how do I call a program in "Single Mode" ?
 SS> It souds like you need the recently translated Magic Programmings
 SS> Doc's.

Yes I have it but it is not clear about this point. Seems that only
application 0 (the shell/Thing) can do the single mode call, freezing all
other applications and releasing memory, this is the SINGLE.TXT, but does not
say what to do if I am not application 0:

Description of "single mode" of Mag!X
==========

Position: Mag!X 1.12
Andreas Kromke, 4.3.93
English translation: Peter West, April 99

Mag!X distinguishes between three differently paired types of applications:

a) The application #0
b) Accessories
c) Other applications (ap_id > 0)

The following call serves for launching programs under Mag!X:

*
* int shel_write(int doex, int isgr, int isover, char *cmd, char *tail)
*

Warning: MultiTOS works in a way that is completely incompatible to previous TOS versions. The new calls are controled via <doex> (0 here is program launch with automatic isgr-identifier and 1 with manual isgr-identifier, etc.) while "isover", which is called "iscr" here, controls the ARGV passing.

Thre are 5 different possibilities to launch applications from within others ("magx.h"). Here are the parameter values for <isover>:

```
* #define SHW_IMMED      0                        /* PC-GEM 2.x  */
* #define SHW_CHAIN      1                        /* TOS         */
* #define SHW_DOS        2                        /* PC-GEM 2.x  */
* #define SHW_PARALLEL   100                      /* MAGIX       */
* #define SHW_SINGLE     101                      /* MAGIX       */
```

Of these, modes 0 and 2 are not supported by Mag!X. <doex> must always be 1, otherwise only previous shel_write() calls will be revoked (as in TOS 1.04).

1. SHW_PARALLEL
   A new application will be created. It inherits all standard paths and files from the current application. The new application runs in parallel to the previous one. One will only get an error code if a memory shortage occured during set-up. There is no message at the termination of the new application (no "death-of-child").
2. SHW_CHAIN
   This is the procedure under TOS. The program makes the call, and after terminating itself the AES launches the new program. SHW_CHAIN does not work with desk accessories, as these must never be permitted to terminate.
   The new program inherits the standard paths and files that the previous program had at the time of its launch. In general these are in turn the ones that the program had that earlier launched the "ancestor" of the application with SHW_PARALLEL. In the case of application #0 therefore the new program gets the standard paths of the AES.
   If DESKTOP.APP (shell of GEM 2.2) is installed as a shell, then Mag!X will insert the current path and drive before the filename.
3. SHW_SINGLE
   Works like SHW_CHAIN, with the exception that before calling the program all applications apart from application #0 and #1 (SCRENMGR) are frozen. The programs are unfrozen once more after the program terminates as long as it did not make a new shel_write() call with SHW_SINGLE on its part.
   One should add that from Mag!X 2.00 onward when calling shel_write in SHW_SINGLE mode the current paths of the caller are passed to the parent and hence to the new program. Warning: The paths of the calling program are destroyed after this, though this is not critical as the call following shel_write is generally a Pterm.

The loops for SHW_CHAIN and SHW_SINGLE look like this:

For application with ap_id > 0:

```
     while(doex)
          start(isgr, cmd, tail);
```

For application #0:

```
     while(world_is_turning)
          {
          start_desktop();
          while(doex)
               {
               if   (single_mode && single_mode_not_yet_activated)
                    activate_single_mode;
               else unfreeze_programs_if_appropriate;
               start(isgr, cmd, tail);
               }
          unfreeze_programs_if_appropriate;
          }
```

How do I launch a program in "single mode"?:

a) Ensure that I am application #0 (i.e. ap_id == 0).
b) Set paths and drive for the new program.
c) shel_write(TRUE, isgr, SHW_SINGLE, cmd, path);
d) All important settings to temporary file or shell-buffer.
e) appl_exit()/v_clsvwk()/Pterm0.

How do I launch a program in "chain mode"?:

a) If appropriate set paths and drive for the new program and make a call
```
          shel_write(TRUE, dummy, SHW_SINGLE, dummy2, dummy3);
```
in order to set the paths for the new program (incompatible to TOS).
b) shel_write(TRUE, isgr, SHW_CHAIN, cmd, path);
d) All important settings to temporary file or shell-buffer.
d) appl_exit()/v_clsvwk()/Pterm0.

After the program terminates the shell will be reloaded automatically.
When calling the shell one gets in the command line (->shel_read) the "magic" sequence (magx.h):

```
/* tail for default shell */

typedef struct
     {
     int  dummy;                  /* a null-word                */
     long magic;                  /* 'SHEL', if it's a shell    */
     int  isfirst;                /* first call of the shell    */
     long lasterr;                /* last error                 */
     int  wasgr;                  /* program was a graphic-app. */
     } SHELTAIL;
```

If <isfirst> is set then the status is to be read from something like
DESKTOP.INF, if <isfirst> is not set then one takes the temporary file or
shell-buffer.
<lasterr> is the return value of the program running previously. If this
was a GEM program then the error will already have been displayed in an
alert box. It is well known that the longword is negative if the error
occurred with Pexec itself; a program return value always has the high
word 0.

Do you have some examples to call directly MacOS witout use XCMD? I'm interesting to see it.

Thanks
Olivier

Then I haven't a clue, perhaps one of the replacement VDI's has a
function to help, unless there is some way to temporarily open another
workstation fooling it into using the "other res" and pinch its
mappings iyswim.

Ah yes, your two question above make that clear. Would require an asm
front-end to reconstruct a C environment. Not impossible but hardly
any point for a timer!

>Another point you have to pay attention to is that you do not use any non

Offhand, I seem to recall the deferred vertical blanking list can have
a "standard C call" shoved in. As you state, there is little point -
asm is best. ;-)

NVDI 5 has vr_transfer_bits() to handle all sorts of transformations,
even with dithering, color palette optimizations, and so on.

Ciao

Thomas

Is it possible to loosen up or disable what ever MiNT does to check
the return data from the FPU? I know that my FPU isn't as stable as on
a stock machine, sometimes causing Gembench or FPB Bench to lockup,
but this only occurs under MiNT. TOS (4.04) seems to let the dirty
data go and not complain. Photoline and Phoenix crash quite a bit
under MiNT with the error, but work fine under TOS. The image
processing results are the same AFAIK.

TIA,

Mike

>RA>screen normally.
>
>Again: why?

Because if every program was responsible for protecting the underlying surface of the screen for all their displays, then the entire system RAM would soon be used up for a lot of screen buffers, all of which would mainly be duplicates of each other, with minor update differencies. The same applies, with irrelevant variations, if the AES itself would do this same kind of primitive buffering when APPs open windows etc. In both cases this kind of approach leads to extreme waste of system RAM space, and for large resolutions the extensive buffer copying will consume more time than the overhead costs of a message system.

The methods of GEM were designed especially to avoid such inefficiencies by requiring only that each APP be able to redraw the information for those windows that it owns, and that appropriate messages are sent to allow all APPs involved to do their parts of this work. The AES itself works as the message center for this update work, ensuring that all APPs are told to update only the relevant portions of the screen.

The only exceptions (small dialogs, menus, popups) are for small areas of extremely temporary nature, where the savings would not motivate the overhead costs of the message system. (Could cause significant slowness)

These are the main design principles of GEM AES screen updating, and any method which abandons these principles is thereby a non-GEM method.

>RA>Simple buffering of the entire screen is not a part of this concept.
>
>No one's talking about the whole screen (in general)

But that was the subject of the original post.
How to cause GEM to refresh the entire screen !

And for that particular purpose it is definitely wrong for any
part of the system to implement it by a simple buffering scheme.

>RA>As stated above, that would be a non-GEM method of implementation.
>RA>Only a few special screen operations should use that method, such as
>RA>drop down menus.
>
>And why is the buffer method used there?

Because they concern so small and temporary screen usage that their
incorporation in the rectangle lists would cause an unwarranted and
overly large overhead.

>Think back when GEM was developed!
>Memory was expensive. For drop down menus the fast redraw was neccessary
>because the handling would have been much too slow ig it would have been done
>by redraws. Buffering dialogs would have cost the expensive memory of another
>buffer. As the speed of restoring the dialog background wasn't that time
>critical they could use the more cheap redraw method.

I am aware of all that.

>IMHO the presence of form_dial(FMD_START) indicates that the buffering was
>planned

I don't see why. Proper reservation of update rectangles is meaningful
regardless of what scheme is used to restore the surface content later,
and that is why DR included it. To keep the interface symmetrical and
avoid dependency on any particular internal redraw implementation.

>or at least DR didn't want to say no to the buffering method in future,

They did not want to impose any limits for the future, this is true,
but I doubt that they considered simple buffering schemes suitable.

They were much more aware of multiprocess needs than Atari were, and
it is very clear even from the earliest GEM documentation that DR were
intending to make this into a real multitasking system. Unfortunately
Apple (who themselves had stolen most McIntosh ideas from 'Smalltalk')
threatened them with a costly lawsuit if they didn't drop those plans.

Those threats were not realistic, as Apple didn't really have a solid
case (like I said, they had stolen most ideas too), but DR could not
afford even a case they would win, so they backed down. That is why
GEM developments were frozen for so many years, until Atari managed
to 'mollify' Apple, who were no longer worried about PCs being given
GEM to outcompete McIntosh (as DR had originally planned).

>when memory would be cheaper

That is not really relevant. As RAM size increases at lowered prices, the screen resolution sizes also rise, making 'simple buffering' as unsuitable today as when GEM was newborn.

eg:
My normal work resolution is 960x720 pixels with 8 bitplanes. This means that the screen size is 691200 bytes, and as (on all TOS systems) the max ST-RAM size is 14680064 bytes, the screen size is appx 4.7% of total RAM, meaning that the 'blittable' RAM can hold at most 21 such buffers.
(But then all DMA IO becomes blocked, as it too needs ST-RAM.)

GEM was originally designed for STs, where the screen size is 32000 bytes for all original resolutions. The most common STs had a RAM size of just one megabyte, which is 1048576 bytes, making the screen portion of that size appx 3.05%, meaning that the RAM could hold at most 32 such buffers.
(Again ignoring all other RAM needs.)

As you can see, the situation is actually worse now on my expanded Falcon, than it was in the old days on a 1040 STFM. Simple full-screen buffering still leads to disastrous RAM waste. The same goes for buffer copying time when the screen RAM size is now over twenty times larger.

Arguably, the 520 ST could have been used for the comparison instead, but the numbers are not sufficiently different (max 16 buffers) to make me feel that the situation has changed very much since then.

>RA>In any case form_dial(FMD_FINISH) should always result in messages
>RA>being sent to the owners of windows underlying the specified rectangle.
>
>No, it should result in a redraw (it defines an aim, not a method)

Nitpicking, but correct I suppose :-)
The form_dial call does only define that a redraw should be performed.
It is the design principles of GEM that defines that it should be done by sending redraw messages to the window owners. This alters nothing.

>RA>form_dial(FMD_FINISH) should cause the same window update messages
>RA>when used alone, this much is true, but it is still not advisable to
>RA>use it that way.
>
>AFAIK Atari documented it that way. And this is not advisable then?

AFAIK they did not documented it that way. What they did was to describe the functions as separate entitities, which they always did even for those functions that are dependent on others having been called earlier. The need for such things being used symmetrically is mostly inherent in the design.

eg:

appl_init and appl_exit are used to log in and later to log out an APP in the GEM system. There is never any need to explicitly state the rule that appl_exit should not be used without first having called appl_init, as the dependency is implicit in the context.

The same (in a very different context) goes for FMD_START and FMD_FINISH. The latter is used to finish a graphic process, so that the screen can be restored to what it should be (according to AES and all GEM APPs), and it is not sensible to finish something that was never started.

>RA>The AES can and should use the FMD_START call as a signal to buffer
>RA>only the parts of the screen that are normally owned by the AES, as
>RA>stated above.
>
>Why should the AES buffer something and the applications cannot?

Because they work on different system levels, this can sometimes be useful, without inconsistency. Thinking more deeply about it, however, I don't see that AES really does need to buffer anything in this particular case. But it should take note of the rectangle reservation.

>This would be a too inconsequent design

You mean 'inconsistent' in english. 'Inconsequent' is not a useful form, and the closest useful one ("inconsequential") does not have the same meaning as the german word you were probably thinking of. Instead it is more synonymous with 'unimportant', which I do not think that you meant.

Fortunately I know some german, and 'inkonsekvent' means the same thing in swedish too, but you should avoid using 'inconsequent' in discussions with people that only know english. They might feel insulted by it, as it does mean that you find what they said to be so unimportant as to lack any relevant meaning.

>RA>Many AES enhancements link into this call however, and add
>RA>interpretations of their own, and in most cases these *require* paired
>RA>usage.
>
>Many software has bugs

Yes, but I would hesitate to call this a bug. It is a dependency of a kind that I too would prefer for programmers to avoid, regardless of the screen update methods used. Nevertheless, much existing software does have such dependencies.

>RA>Redraw messages are the only legal GEM method of redrawing the work
>RA>areas of windows belonging to other APPs.
>
>Yes

I'm glad we agree on one basic premise at least :-)

>RA>For its own windows any APP may use whatever method it pleases (while
>RA>screen is locked for updating), but not for any other areas. Those
>RA>must be handled through GEM.
>
>form_dial() calls _are_ GEM (even if they are provided by a GEM extension
>like a utility)

That is true of course, and I did not mean to imply that they were not. What I referred to here was direct restoration from a screen buffer into screen areas owned by some other APP. That would be quite illegal.

>RA>Atari have described separately the use of many functions, which even
>RA>so are in many cases dependent on being used with other functions.
>RA>That is the case here too.
>
>AFAIK this is not the case here

That is a matter of opinion which can hardly be proven either way, nor is it even certain that any proof about Atari opinions would be strictly relevant today anyway, since they dropped active development of GEM long ago (when they abandoned Falcon for concentrating on Jaguar).

The fact remains that used as I recommend, the function will not cause any known software to misbehave, whereas the method you recommend, of using FMD_FINISH alone, will cause some software to misbehave and/or even bomb. 'Right or wrong' aside, this does mean that programs using my recommended way of using form_dial will run problem free for a larger number of users.

>RA>Putting it differently, the use of FMD_FINISH implies an earlier use
>RA>of FMD_START. (else what is being finished ?)
>
>IMHO the documentation of the single use of form_dial(FMS_FINISH) is a hack
>by Atari for sending a redraw message to all applications because of lacking
>a broadcast. It certainly would have been better to implement a broadcast
>insted but that wouldn't have been compatible with the first versions :-(

And that 'hack' was written at at time when the current multitasking systems (not to mention their extensive enhancements) had not even been invented. It was also done by Atari themselves, who did not have the same insight into the needs of multiprocess systems that DR had.

If Atari had defined the system from the start, I doubt if FMD_START would have existed at all, nor the entire rectangle system, since these were the inventions of DR. DR did not define a symmetrical pair of functions with the intention that one half of that pair be used separately. That is not consistent with their methodology.

Needless to say (but I will anyway), I regard DR (rather than Atari) as
being the real authorities on all original GEM functions.

>RA>Using paired form_dial calls as described can not cause any problem at
>RA>all in a correct GEM implementation, as the FMD_FINISH call should

>
>form_dial() is a specification of an interface, not an implementation. And I
>don't believe that you can find a documentation of the used algorithm. That's
>simply because an interfacec is an abstraction from the algorithm behind it
>with the advantage that you can change the algorithm

I fully agree with what you say here. The form_dial specification as such
does not include any details on how AES should be implemented. But we are
not dealing with an isolated function when we really use form_dial in our
programs. Then we are dealing with that function as implemented in the
running AES, and therefore the implementation of other AES functions does
matter.

Use

```
  shel_write(1,1,100,...);
```

under MagiC and

```
  shel_write(0,1,0,...);
```

under MiNT.

Hi.

I'm working on a routine so that when I press my right mousebutton a menu will be engaged.

The menu is written as a dialogue in a RSC file.

I use the following GFA code to do this:

```
RSRC_LOAD (FILE)
RSRC_GADDR (0,0,adr%)
FORM_CENTER (adr%,x,y,b,h)
FORM_DIAL (0,x,y,b,h,,x,y,b,h)
OJBC_DRAW (adr%,0,2,x,y,b,h)
  --- evnt_multi loop here ---
FORM_DIAL (3,x,y,b,h,x,y,b,h)
```

The problem is that it is centered - as form-center does, but I want

it to appear where my mousek/mousey is placed.

Can anyone please help me with a better routine?

Grettings

Here is where you need to insert the coordinate adjustments

>FORM_DIAL (0,x,y,b,h,,x,y,b,h)
>OJBC_DRAW (adr%,0,2,x,y,b,h)
> --- evnt_multi loop here ---

>
>Can anyone please help me with a better routine?

I'd rather describe to you how to do it yourself, and in the long run I'm sure you too will be much happier with a solution so achieved.

Note also that I am not so familiar with GFA coding, so I will use C notation in my examples, and assume 16bit integer calculations throughout. Adapting this to GFA will be up to you.

The essential needs are quite simple, in that you need to adjust the coordinates calculated by form_center so as to match your mouse position before you proceed with the first form_dial etc.

Now, the centered box is defined by (x,y,b,h) as used above, and I will assume that you have some (mx,my) pair of variables for the mouse pos.

This means that the offsets you would have to add to (x,y) would be:

```
ox = mx-x-b/2;
oy = my-y-h/2;
```

But this will cause problems if the mouse is too close to a screen edge, so it will have to be checked, and possibly limited towards the center. So the simple calculation shown above is not suitable, and will be replaced by better code incorporating the necessary checking.

In fact the form_center values for (x,y) are of no interest here, as we really only care about (b,h) as it is these that represent the calculated dialog size. (x,y) are only to be used as our new coordinate results.

To perform the check we also need variables for the limits, but those values need to exclude the menu line, as dialog boxes are not allowed to overlap the menu. Thus we must calculate the desktop work area.

So:

```
----- start of insertion -----
dummy = wind_get(0,4,&wx,&wy,&wb,&wh);  /* calc desktop work area */
x = mx - b/2;
if  ( x < wx )          /* wx 'should' be 0 but do it the generic way */
    x = wx;
else
    if  ( (x + b) > (wx + wb) )
        x = wx + wb - b;
y = my - h/2;
if  ( y < wy )
    y = wy;
else
    if  ( (y + h) > (wy + wh) )
        y = (wy + wh) - h;
----- end of insertion -----
```

Translating the above to GFA syntax and inserting it at the point specified above should give you the classical form of mouse centering limited so that the entire dialog will always be visible on the legal part of the screen.

If the rez is to low for it, then the dialog will simply be based at the first legal pixel in the work area.

> had finished, but this is clearly not the desired behaviour.
> I'm wondering which method a desktop uses in a multi-task environment to
> launch new applications, because this is exactly what I should use.

Here some explanations of shel_write()
int shel_write(int mode,int flag1,int flag2,*commande, *tail)
mode&0xFF must be 1 for launch imediatly

if mode&0xFF00 !=0 commande use:
typedef struct _shelw

```
   {
      char *newcmd;
      long psetlimit;
      long prenice;
      char *defdir;
      char *env;
   }
```

I not explain is use.
flag1 : 1 -> GEM program, 0-> TOS program (for use Tos2Win or VT52 the output text in GEM window (work only if instal))
flag2 : 100 -> parrallel launch , 101 -> single mode
if multitasking system use 100 because 101 work differently beetween Mint and Magic (it not stop for the end of sun prog under mint)
if you work under monotasking system prefer Pexec()
commande : string of program to lunch or SHELW struct (see mode)
tail : argument for program (attention first caractere is the number of caracters in string if you use GCC if PureC I think PureC calculate it)
For more informations see:
http://www.utbm.fr/les.personnes/olivier.landemarre/exec.htm
it's in french sorry, but there is good traductors.
It work well and I use shel_write() for GCCShell

Hello All,
I have an Atari Jaguar+CD system for sale. The system includes to controllers, about 12 games, and the Atari Jaguar Gamer's Guide (I don't remember the exact title). I will entertain all reasonable offers.
If you are interested, you may email me at angief18@aol.com.
Thanks,
Sam Ferrer

Hi Ronald!

RA>Because if every program was responsible for protecting the underlying
RA>surface of the screen for all their displays, then the entire system
RA>RAM would soon be used up for a lot of screen buffers,
Em, we are talking about form_dial(), aren't we?

RA>and for large resolutions the extensive buffer copying will consume
RA>more time than the overhead costs of a message system.
If you compare that, you have to add the time fr redrawing to the time the
message system needs and then the copying will be (much) faster

RA>The methods of GEM were designed especially to avoid such
RA>inefficiencies by requiring only that each APP be able to redraw the
RA>information for those windows that it owns, and that appropriate
RA>messages are sent to allow all APPs involved to do their parts of this
RA>work. The AES itself works as the message center for this update
RA>work, ensuring that all APPs are told to update only the relevant
RA>portions of the screen.
Yes, that's right

RA>The only exceptions (small dialogs, menus, popups) are for small areas
RA>of extremely temporary nature, where the savings would not motivate
RA>the overhead costs of the message system. (Could cause significant
RA>slowness)
Isn't a dialog (we're talking about modal ones) something extremely temporal?
The only important difference I can see ist that it can exceed the quarter
screen buffer. And this is only a technical limit that could be eliminated by
increasing the buffer size

RA>>Simple buffering of the entire screen is not a part of this
RA>>concept.
JW>No one's talking about the whole screen (in general)
RA>But that was the subject of the original post. How to cause GEM to

RA>refresh the entire screen !
Yes, but this buffering of the whole screen could only occure, if you call a pair of form_dial()s for refreshing the whole screen (or if you have a dialog that has the extend of the screen)

RA>And for that particular purpose it is definitely wrong for any part of
RA>the system to implement it by a simple buffering scheme.
That's a reason why I say you shloud use a single form_dial() for refreshing the whole screen

RA>Because they concern so small and temporary screen usage that their
RA>incorporation in the rectangle lists would cause an unwarranted and
RA>overly large overhead.
The larger size of a dialog (compared to an alert, drop down menu or popup) doesn't make the redrawing method faster than buffering. And the memory usage for buffering can be limited to the memory for 1 screen

RA>Proper reservation of update rectangles is meaningful regardless of
RA>what scheme is used to restore the surface content later, and that is
RA>why DR included it. To keep the interface symmetrical and avoid
RA>dependency on any particular internal redraw implementation.
Yes, and the task of form_dial(FMD_START); [...] form_dial(FMD_FINISH); is to restore the content of the screen/rectangle when doing the form_dial(FMD_START), isn't it?

RA>They did not want to impose any limits for the future, this is true,
RA>but I doubt that they considered simple buffering schemes suitable.
They did it for alerts and other things. Why shouldn't they do it for dialogs?
The only reason I can think of is the larger buffer that could be needed, which IMO is no real reason when having a machine with some megabytes

RA>They were much more aware of multiprocess needs than Atari were,
Yes, I think so too

RA>Those threats were not realistic, as Apple didn't really have a solid
RA>case (like I said, they had stolen most ideas too), but DR could not
RA>afford even a case they would win, so they backed down. That is why
RA>GEM developments were frozen for so many years, until Atari managed
RA>to 'mollify' Apple, who were no longer worried about PCs being given
RA>GEM to outcompete McIntosh (as DR had originally planned).
That's not correct.
Apple threatened DR with the lawsuit after DR has sold a version of GEM to Atari. That's the reason why Atari had a "good" desktop while PC-GEM got a crippled one

RA>That is not really relevant. As RAM size increases at lowered prices,
RA>the screen resolution sizes also rise, making 'simple buffering' as
RA>unsuitable today as when GEM was newborn.
But the size of the programs won't increase in the same extent. And as I said above: one buffer would be enough

RA>The same (in a very different context) goes for FMD_START and

RA>FMD_FINISH. The latter is used to finish a graphic process, so that
RA>the screen can be restored to what it should be (according to AES and
RA>all GEM APPs), and it is not sensible to finish something that was
RA>never started.
That's why I call the single form_dial() a hack. But it's a working one

RA>You mean 'inconsistent' in english. 'Inconsequent' is not a useful
RA>form, and the closest useful one ("inconsequential") does not have the
RA>same meaning as the german word you were probably thinking of.
Well, according to my dictionary 'inconsequent' and 'inconsistent' both mean
the same

RA>Yes, but I would hesitate to call this a bug.
If an AES extension relies on a not explicitly documented relation between
two calls and if it's not error resistant it IMO has a bug

RA>What I referred to here was direct restoration from a screen buffer
RA>into screen areas owned by some other APP. That would be quite
RA>illegal.
Why should it be illegal if the application is not able to change the content
of the window inbetween?

RA>The fact remains that used as I recommend, the function will not cause
RA>any known software to misbehave,
Sorry, but you're wrong here. There are extensions that use the form_dial()
calls to buffer/restore the background and with this extensions your
recommendation will not cause a redraw

RA>And that 'hack' was written at at time when the current multitasking
RA>systems (not to mention their extensive enhancements) had not even
RA>been invented. It was also done by Atari themselves, who did not have
RA>the same insight into the needs of multiprocess systems that DR had.
The hack is to document the usage of a call in a way that could formerly
considered to be a bug, to get a new feature and exploiting the
implementation in older versions to assure compatibility

RA>If Atari had defined the system from the start, I doubt if FMD_START
RA>would have existed at all, nor the entire rectangle system, since
RA>these were the inventions of DR. DR did not define a symmetrical pair
RA>of functions with the intention that one half of that pair be used
RA>separately. That is not consistent with their methodology.
I think so too

RA>Needless to say (but I will anyway), I regard DR (rather than Atari)
RA>as being the real authorities on all original GEM functions.
Yes, but DR never said anything about how to redraw the whole screen

RA>Then we are dealing with that function as implemented in the running
RA>AES, and therefore the implementation of other AES functions does
RA>matter.
You are relying on the implementations you know. That's dangerous

Bye

Joerg

>RA>Because if every program was responsible for protecting the underlying
>RA>surface of the screen for all their displays, then the entire system
>RA>RAM would soon be used up for a lot of screen buffers,
>
>Em, we are talking about form_dial(), aren't we?

Yes and no.

Yes: We are talking of the form_dial function.
No: We were not really talking of its normal use in connection to forms.
      Instead we were talking only of the correct way to use it in causing
      a full screen redraw. That was what the original query concerned.
      But discussions of this kind always tend to 'wander' a bit.

>RA>and for large resolutions the extensive buffer copying will consume
>RA>more time than the overhead costs of a message system.
>
>If you compare that, you have to add the time fr redrawing to the time the

>message system needs and then the copying will be (much) faster

Faster for most cases, but not necessarily correct. What should be redrawn by a GEM APP at any given time is only up to that APP, not to the content of any buffer. This is especially relevant to the kind of situation addressed by the query, where the original screen data had been corrupted by non-GEM operations.

>RA>The only exceptions (small dialogs, menus, popups) are for small areas
>RA>of extremely temporary nature, where the savings would not motivate
>RA>the overhead costs of the message system. (Could cause significant
>RA>slowness)
>
>Isn't a dialog (we're talking about modal ones) something extremely temporal?

Now I see your mistake. You thought we were discussing the normal usage of the function in handling forms, but that was not the case. For such uses, and for moderately sized dialog forms, I do agree with you, but only for situations where the AES is in total control, so that no complexities can occur that affect the validity of the buffering. That is often not so.

Also, if we are to discuss dialogs in general, then I will not restrict myself to the modal ones. On a modern TOS machine both modal and non-modal dialogs must coexist.

>The only important difference I can see ist that it can exceed the quarter
>screen buffer. And this is only a technical limit that could be eliminated by
>increasing the buffer size

But that can only be done safely by some TSR, not by a normal APP, and it is quite inapproprioate for any APP to use that buffer anyway, as it may already hold data placed there by the AES. Code outside of the AES should only access that pointer in order to enlarge the buffer, and that should only be done by a TSR. That is ok for a GEM enhancer, which is normally installed as a TSR anyway.

>RA>>Simple buffering of the entire screen is not a part of this
>RA>>concept.
>JW>No one's talking about the whole screen (in general)
>RA>But that was the subject of the original post. How to cause GEM to
>RA>refresh the entire screen !
>
>Yes, but this buffering of the whole screen could only occure, if you call a
>pair of form_dial()s for refreshing the whole screen

No, on no version whatever of TOS has that led to such a consequence.
What I meant was simply that if you want buffering to replace AES redraw messages, like you seem to want, then the entire screen must exist in a buffer for cases like this one.

The query did ask for how to refresh the entire screen, in the most legal manner, and to me that means using form_dial calls properly paired.

>(or if you have a dialog that has the extend of the screen)

With your suggested method that would have such an effect too, but with normal TOS methods that will not happen. And the same is true of MTOS, Geneva, NAES, and MagiC. I'd say that a rather strong consensus exists in favor of the message-based redraw method among the implementors, and I heartily agree with them. It is a superior method.

>RA>And for that particular purpose it is definitely wrong for any part of
>RA>the system to implement it by a simple buffering scheme.
>
>That's a reason why I say you shloud use a single form_dial() for refreshing
>the whole screen

I disagree. I think form_dial calls should be used in symmetrical pairs.

>RA>Because they concern so small and temporary screen usage that their
>RA>incorporation in the rectangle lists would cause an unwarranted and
>RA>overly large overhead.
>
>The larger size of a dialog (compared to an alert, drop down menu or popup)
>doesn't make the redrawing method faster than buffering.

I never said so. What I spoke against was waste of RAM, and the inability to restore screen data after it has been corrupted. Simple buffering schemes can worsen the situation they should help, if corrupted data ends up in the buffer. The message system is immune to all such effects.

>And the memory usage for buffering can be limited to the memory for 1 screen

We can implement a new system of rectangle lists in parallel to the one already existing, but administrating them will not be instantaneous, and the effect will not be as great as you think, as buffered areas can overlap, and it must be possible to restore intermediate screen states.

Also, what this will mean is that we implement a centralized redraw system, otherwise very similar to what we have, except that the individual APPs are not asked to confirm that the data is valid. It is just taken from a buffer.

This means that when any screen part has become corrupted it can stay so, even where the present system would have fixed it, as any corrupted data that has made it into the buffer would be used to redraw the screen. Only the APP that owns such a screen area can restore it properly.

>RA>Proper reservation of update rectangles is meaningful regardless of

>RA>what scheme is used to restore the surface content later, and that is
>RA>why DR included it. To keep the interface symmetrical and avoid
>RA>dependency on any particular internal redraw implementation.
>
>Yes, and the task of form_dial(FMD_START); [...] form_dial(FMD_FINISH); is to
>restore the content of the screen/rectangle when doing the
>form_dial(FMD_START), isn't it?

Essentially yes, but that is not the whole story. What should be restored is not necessarily what did reside in the screen RAM at that time, but what the AES and the GEM APPs would have *liked* to have on the screen.

A pure buffering scheme can not deal with that difference, but the message system of GEM can. It will redraw the screen correctly regardless of what corruption may have existed in the past. That is a very great strength.

>RA>They did not want to impose any limits for the future, this is true,
>RA>but I doubt that they considered simple buffering schemes suitable.
>
>They did it for alerts and other things. Why shouldn't they do it for
>dialogs?

They did it for things were AES itself is in full control of the operation. That is not the case for dialogs handled by an APP. FMD_START itself does not freeze the screen updating (and shouldn't do so).

In order for simple buffering to be valid, it is necessary that no other APP can draw anything on that screen area until it has been restored from the buffer again. AES imposes that rule for the menus, and alerts, so they are never a problem (as long as GEM rules are obeyed by APPs), but there is no way to impose such a rule for the general dialogs of multitasked APPs. (or singleTOS ACCs)

>The only reason I can think of is the larger buffer that could be needed,

That is another valid reason, but the main reason is given above.

>which IMO is no real reason when having a machine with some megabytes

Perhaps, but if such buffering is done by many APPs at the same time, which happens here now and then, the amounts of RAM used would grow.

----- snip ----- re: DR, their plans, and the threats that stopped them

>Apple threatened DR with the lawsuit after DR has sold a version of GEM to
>Atari. That's the reason why Atari had a "good" desktop while PC-GEM got a
>crippled one

What you are saying is naturally true, but I don't see how it contradicts what I told of. DR were already converting the code for PC use, when Apple grew aware of what was happening, and they told DR to remove some of the abilities of the PC version 'or else'. So DR removed the concept of free numbers of freely movable windows, thus making PC-GEM useless. (Compared to Atari GEM.)

It was the sale of GEM to Atari that drew Apple's attention to it, but it was the plan to implement the same thing for PCs that scared Apple into a fit. It would have been very interesting to see what would have happened if DR could have afforded to 'call the bluff' of Apple, and go on to give PCs a fully capable GEM, at a time when the main M$ products were still a simple BASIC interpreter, and a badly botched early MSDOS.

>RA>That is not really relevant. As RAM size increases at lowered prices,
>RA>the screen resolution sizes also rise, making 'simple buffering' as
>RA>unsuitable today as when GEM was newborn.
>
>But the size of the programs won't increase in the same extent.

I never mentioned program size. I spoke of the RAM size needed for storage of screen data in high resolutions.

>And as I said above: one buffer would be enough

No. Think about it. The total area needed for restoration of the screen as it looked at one given point in time is only one full screen buffer. But various parts of the screen may have been reserved at different times, and it is perfectly legal for the areas to overlap. The only good way to deal with that is to have the dialogs in windows, and use the AES messages to restore window contents. That is the only method I know of that can deal with successive redraw of all intermediate screen states.

A similar method could be designed based on buffering, rather than on asking each APP to regenerate the data, but there would be many drawbacks to it, not least the complexity of that code (a new rectangle system), and the inability to avoid buffering any screen corruption that may have occurred.

>RA>The same (in a very different context) goes for FMD_START and

>RA>all GEM APPs), and it is not sensible to finish something that was
>RA>never started.

>
>That's why I call the single form_dial() a hack. But it's a working one

But what is the problem you see in using the paired form ?
That too works excellently, and it does work with utilities that are
'allergic' to the unpaired form. I still don't see your point.

You seem to want someone to reinvent GEM to use only buffering instead
of redraw messages, and it seems to be for this reason that you want
to reserve FMD_START for use only in saving buffer data.

I, on the other hand, do not think this will ever happen, and would not
be in favor of such an implementation anyway. The present one is better.

>RA>Yes, but I would hesitate to call this a bug.
>
>If an AES extension relies on a not explicitly documented relation between
>two calls and if it's not error resistant it IMO has a bug

All AES enhancements invented since Atari stopped developing are also
undocumented by their 'official' documents, and no software at all can
be completely resistant to errors, but I hesitate to call them bugged
even so.

In this particular case I do consider the tie between FMD_START and
FMD_FINISH to be implicitly clear, even if not explicitly stated.

>RA>What I referred to here was direct restoration from a screen buffer
>RA>into screen areas owned by some other APP. That would be quite
>RA>illegal.
>
>Why should it be illegal if the application is not able to change the content
>of the window inbetween?

And how do you know that, considering that reservations can overlap, and we
do have multitasking (even under singleTOS, for the ACCs) ? The answer is
that it can only be known for some special cases, but not for all cases.
For those other cases it is is illegal, and since they can't be recognized
easily the method as such is inappropriate.

>RA>The fact remains that used as I recommend, the function will not cause
>RA>any known software to misbehave,
>
Sorry, but you're wrong here. There are extensions that use the form_dial()
>calls to buffer/restore the background and with this extensions your
>recommendation will not cause a redraw

Aha, so we have two conflicting groups of enhancers. One which does use
the message system of GEM compatibly, and one which disables part of it,
so that messages are no longer generated for paired form_do's, but only

(very inconsistently) for unpaired form_do(FMD_FINISH...)

I consider the latter implementation inconsistent and inappropriate, and I see many situations where it will not do its job correctly. Its main strength is that it can help some badly written old APPs that lack proper redraw capability (like many old APPs do) to work a little better when other programs open dialogs on top of them.

But the same goal could be achieved without mutilating the consistency of form_dial.

>RA>And that 'hack' was written at at time when the current multitasking
>RA>systems (not to mention their extensive enhancements) had not even
>RA>been invented. It was also done by Atari themselves, who did not have

>
>The hack is to document the usage of a call in a way that could formerly
>considered to be a bug, to get a new feature and exploiting the
>implementation in older versions to assure compatibility

What you have described above is not what I consider compatibility.

Also, you yourself rely on an undocumented assumption that you evidently consider implicit to what Atari said (though I disagree).

Just because Atari said that a single FMD_FINISH call will broadcast the messages, you seem to have assumed that paired ones shouldn't.

Actually the natural implication is the opposite. The statement that the use of a single FMD_FINISH call will broadcast the messages doesn't exclude the possibility that it was preceded by an FMD_START call. Thus it is very clear that the FMD_FINISH calls should always result in redraw messages for the given rectangle, regardless of whether they are paired with a preceding FMD_START call or not.

>RA>Needless to say (but I will anyway), I regard DR (rather than Atari)
>RA>as being the real authorities on all original GEM functions.
>
>Yes, but DR never said anything about how to redraw the whole screen

AFAIK that is true, but then, they didn't 'stay with us' very long, and they didn't foresee all future needs, though they were good at it.

>RA>Then we are dealing with that function as implemented in the running
>RA>AES, and therefore the implementation of other AES functions does
>RA>matter.
>
>You are relying on the implementations you know. That's dangerous

No, you exaggerate.

Relying on the fact that a paired use of FMD_START and FMD_FINISH will
redraw the specified area can never ever cause any harm at all. The
very worst thing that can happen, and even that only with the extensions
you mentioned, is that the area does not get redrawn as it should.
That is not what I call 'dangerous'.

Hi Ronald!

RA>Now I see your mistake. You thought we were discussing the normal
RA>usage of the function in handling forms, but that was not the case.
What was the case then?

RA>For such uses, and for moderately sized dialog forms, I do agree with
RA>you, but only for situations where the AES is in total control, so
RA>that no complexities can occur that affect the validity of the
RA>buffering. That is often not so.
Example?

RA>Also, if we are to discuss dialogs in general, then I will not
RA>restrict myself to the modal ones. On a modern TOS machine both modal
RA>and non-modal dialogs must coexist.
We're talking about form_dial() and therefore about modal dialogs. There
certainly are unmodal dialogs, but you don't need form_dial() for them so
that they are not relevant here

RA>But that can only be done safely by some TSR, not by a normal APP, and
RA>it is quite inapproprioate for any APP to use that buffer anyway, as
RA>it may already hold data placed there by the AES.
I thought about increasing the buffer by the AES programers

RA>Code outside of the AES should only access that pointer in order to
RA>enlarge the buffer, and that should only be done by a TSR. That is ok
RA>for a GEM enhancer, which is normally installed as a TSR anyway.
Is there such a pointer?
Well, that doesn't matter because I think that no application has to deal
with it

RA>No, on no version whatever of TOS has that led to such a consequence.
What not is can never be?

RA>What I meant was simply that if you want buffering to replace AES
RA>redraw messages, like you seem to want, then the entire screen must
RA>exist in a buffer for cases like this one.
The entire screen must fit in the buffer, yes

RA>The query did ask for how to refresh the entire screen, in the most
RA>legal manner, and to me that means using form_dial calls properly
RA>paired.
I know. And you know that and why I disagree with you in that point

RA>With your suggested method that would have such an effect too, but
RA>with normal TOS methods that will not happen. And the same is true of
RA>MTOS, Geneva, NAES, and MagiC.
I know that no currently available OS implements the buffering method

RA>I'd say that a rather strong consensus exists in favor of the message-
RA>based redraw method among the implementors,
These method needs no memory for a buffer and since all these operating
systems have to be able to run no machines with 512KB or 1MB they have to
take care about the memory usage of the system

RA>It is a superior method.
No.
That clearly depends on the point of view (what's more important to you,
spped or low memory usage)

RA>What I spoke against was waste of RAM, and the inability to restore
RA>screen data after it has been corrupted.
And how do you restore "corupted data" if you have no dialog?
Sorry, but this argument is really silly

RA>Simple buffering schemes can worsen the situation they should help,
RA>if corrupted data ends up in the buffer.
Can you explain how that could happen?

RA>We can implement a new system of rectangle lists in parallel to the
RA>one already existing, but administrating them will not be
RA>instantaneous, and the effect will not be as great as you think, as
RA>buffered areas can overlap, and it must be possible to restore
RA>intermediate screen states.
Since when is it possible to nest form_dial()?
And how could that work with the redraw mehtod?

RA>This means that when any screen part has become corrupted it can stay
RA>so, even where the present system would have fixed it, as any
RA>corrupted data that has made it into the buffer would be used to
RA>redraw the screen.
Please tell me how corrupted data can originate and how the can make it into the buffer

RA>What should be restored is not necessarily what did reside in the
RA>screen RAM at that time, but what the AES and the GEM APPs would have
RA>*liked* to have on the screen.
In this case the result is a restore from the buffer with a following redraw induced by the AES or App. This rare case might be not optimal, but there's no problem with that

RA>FMD_START itself does not freeze the screen updating (and shouldn't do
RA>so).
Yes it's not neccessary (but won't hurt) because you first have to lock the screen with wind_update() before doing your dialog stuff

RA>In order for simple buffering to be valid, it is necessary that no
RA>other APP can draw anything on that screen area until it has been
RA>restored from the buffer again. AES imposes that rule for the menus,
RA>and alerts, so they are never a problem (as long as GEM rules are
RA>obeyed by APPs), but there is no way to impose such a rule for the
RA>general dialogs of multitasked APPs. (or singleTOS ACCs)
Just embrace your dialog stuff with wind_update(). This ensures that no other app draw onto the screen while your dialog is displayed

RA>Perhaps, but if such buffering is done by many APPs at the same time,
RA>which happens here now and then, the amounts of RAM used would grow.
Many apps display modal dialogs at the same time?
I've never seen that. And I don't believe you have

RA>So DR removed the concept of free numbers of freely movable windows,
Only in the desktop. The apps continued to have movable windows

RA>I never mentioned program size. I spoke of the RAM size needed for
RA>storage of screen data in high resolutions.
Yes. And I mentioned another thing memory is used for (the programs) to show that the relations between the amounts of memory used for the different tasks changes when the total memory size increases

RA>No. Think about it. The total area needed for restoration of the
RA>screen as it looked at one given point in time is only one full screen
RA>buffer.
Since there can be only one modal dialog at a time and form_dial() cannot be nested, a buffer of 1 screen size is enough. Think about it

RA>But what is the problem you see in using the paired form ?
Aren't you reading my mails?

RA>You seem to want someone to reinvent GEM to use only buffering instead

RA>of redraw messages, and it seems to be for this reason that you want
RA>to reserve FMD_START for use only in saving buffer data.
I said:
FMD_START _could_ be used to save the dialog background and FMD_FINISH with a foregoing FMD_START to restore the saved background

RA>All AES enhancements invented since Atari stopped developing are also
RA>undocumented by their 'official' documents,
No comment to this "argument"

RA>In this particular case I do consider the tie between FMD_START and
RA>FMD_FINISH to be implicitly clear, even if not explicitly stated.
For normal use you're right, but redrawing (the wohl screen) is not the normal use

RA>considering that reservations can overlap
They cannot if you do not nest dialogs and nesting dialogs will not work with the redraw method, too

RA>Just because Atari said that a single FMD_FINISH call will broadcast
RA>the messages, you seem to have assumed that paired ones shouldn't.
You do not want to understand me, do you?
I never said paired ones shouldn't broadcast redraws. I said it is possible that there will not be a broadcast of a redraw message

RA>Actually the natural implication is the opposite. The statement that
RA>the use of a single FMD_FINISH call will broadcast the messages
RA>doesn't exclude the possibility that it was preceded by an FMD_START
RA>call. Thus it is very clear that the FMD_FINISH calls should always
RA>result in redraw messages for the given rectangle, regardless of
RA>whether they are paired with a preceding FMD_START call or not.
You seem to have understand nothing

RA>That is not what I call 'dangerous'.
Replace it with 'likely to produce problems' if you like

Bye

Joerg

Hi J⍰rg,

Having read your post fully I can only come to the conclusion that this our discussion is no longer productive.

The fact that we have different opinions on how some system functions should best be used should not be taken 'personally' by either party, and it seems clear to me that you have taken it so, from some of your responses.

I'm not going to answer in kind, as I still have not taken it as you, but I will mention here, that saying that my arguments are silly, that I don't want to understand you, and that I have understood nothing, is not a good way to clarify anything. And it does mean that further discussion is not meaningful.

There have been misunderstandings on both sides in earlier posts, and there are some in your latest one too, where you misquote something I said into something I did not mean, and then say that my argument was silly. I am prepared to assume that all misunderstandings by both of us were honest ones, but it seems that you are not prepared to do so, and then nothing can be achieved by further discussion.

Also, my original post on this subject was intended merely as some quick advice to a guy with a problem. Somehow this has now developed into a lengthy debate of a kind I never wanted, and really have no time for.

I'm not thereby saying that I disregard all your arguments, for many of the points you made were valid. But some other 'points' you made were merely directed at your mistaken idea of what I meant, rather than against what I really intended. In some of those cases we probably even agree on the real facts, though our different ways of expressing them causes these misunderstandings to hide such agreement.

Possibly it would be better to discuss these things again at some future date, when we have both figured out how to express what we mean clearly enough to avoid the frequent misunderstandings that have affected this present discussion many times.

I suggest that we cut this thread for now, as I'm sure we both have better

things to do than to discuss this stuff over and over. It is quite clear
in any case, regardless of all the other issues brought up, that you and
I disagree completely on the paired/unpaired use of form_dial, and that
neither of us is likely to change his view on that subject. For either
of us to attempt to 'convert' the other would merely be wasted time.

I can accept that situation as it stands, and I hope you can to.

Hi Ronald!

RA>Having read your post fully I can only come to the conclusion that
RA>this our discussion is no longer productive.
That's my impression too

RA>The fact that we have different opinions on how some system functions
RA>should best be used should not be taken 'personally' by either party,
RA>and it seems clear to me that you have taken it so, from some of your
RA>responses.
I have not taken anything personal.
My partly offending answers are a result of some comments/arguments from you
that either had nothing to do with what we were talking about, were unlogical
or just stating your point of view again with ignoring what I've said which
lengthens the discussion without being of any use. And I have more importsant
things to do than superfluous discussions

RA>saying that my arguments are silly, that I don't want to understand
RA>you, and that I have understood nothing, is not a good way to clarify
RA>anything.
I got the impression that you are not interested in a clarification

RA>Also, my original post on this subject was intended merely as some
RA>quick advice to a guy with a problem.
i did so too and I also mentioned a possible problem of your quick advice and
how to make it better

RA>Somehow this has now developed into a lengthy debate of a kind I never
RA>wanted, and really have no time for.
Same with me

RA>But some other 'points' you made were merely directed at your mistaken
RA>idea of what I meant, rather than against what I really intended.
I cannot guess your intention

Bye

Joerg

You'l find that most prog'in examples are in LC5 in the likes of
Atari Compendium and Modern Atari Software. If Mark Baines was still
about he'd jump in here probably in defence of LC5.

Did you get all the bibles with LC?.

Hello,

I have troubles installing GNU C++. I have the 'SDK Atari Software Developement Kit -
Upgrade 1999' CD-rom, with GNU C++ on it. I'm not using Mint, so I suppose I have to use
version 2.72. There is a folder on the CD named 'GCC272'. I've copied it and unpacked
everything. But when I try to compile something, the compiler says he can't find the
include files. So I searched on the CD and I found the folder 'G'. I unpacked the file
'GPINCL20.ZIP' to my harddisk. After setting the right path in 'AGNUS', a development
environment, the compiler finds some of the include files, but he can't find others.
Sometimes, I get errormessages in the include-files.
Does anyone know a solution for this? What am I doing wrong??

Thanks in advance,

Wim De Meester

It did, and the manuals were on sale at one of the Atari shows many years ago from Prospero themselves at a knock-down price. I know, for I bought a set.

Hi!

I'm writing an program, which uses dynamic variables (structures). I'm
using PureC
and standard Falcon with 16MB.
It's a database of word (dictionary). But...
Loading goes very well. But when I'm looking through the database the
computer
takes memory. Why??

Greetings all,

I wonder what solution is best if I want to play notes by using built in hardware, to make it as compatible as possible?

Which way to go? Any suggestions?

OK. I'll try to explain it a little...In my program I have structures like:

```
typedef struct options{
    int i;
    char *name;
....
    struct options *next;
    struct options *prev;
}options;
```

Loading goes like this:

```
struct options *start_bla, *end_bla;
{
    struct options *bla;

    bla = Malloc(sizeof(options));

    start_bla = bla;
    .....    /* Loading functions   - works fine */
    end_bla = bla;
}

void search(void)
{
    struct options *bla;

    bla = start_bla;

    while(bla!=end_bla)
    {
        if(strcmp(bla->name,....)
            /* something */
        else
            bla = bla->next;  !!!!!!!
    }
....
}
```

It's only an idea of my program. Is it enough.
OK. While executing function 'search' computer uses more and more memory!!!!

BTW. How can I subscribe this list (give the email adress)?

Thanks

I am very sorry, but your examples do not look like something that really has run in a computer. ;-)

The following though can be said:
Malloc's effect is !NOT! block structured. The pointer will disappear at the end of a block, the allocated memory will remain allocated and becomes inaccessible.
Before leaving a block, you must explicitly 'free' the allocated memory, by Free(bla), if bla is a local variable within the block.

In general every 'malloc'd chunk must always be explicitely 'free'd.

Another very important advice is: Use malloc for small pieces, not Malloc.
Malloc is a system call, malloc a library call.
malloc is faster and reduces chances of heap fragmentation.
The opposite of malloc is free. :-)

Henk

I need a functional binding for appl_search() as the one in
The Atari Compendium fails to work. Yet another typo in this
book I suspect? I almost works. ;-)

Anyone have one, or can point to some place to find the
proper binding?

Thanks...

I found the following in MT_AES.H (A. Kromke himself)

WORD appl_search(WORD mode, char *name, WORD *type, WORD *id);

control[]={18,0,1,0,0}

which is probably wrong and should be

control[]=18,1,3,1,0}

intin[0]=mode
addrin[0]=name

call the aes in a suitable manner ....

*type=intout[1]
*id=intout[2]

return intout[0]

Sometimes I wonder...

We go to great lengths to fill in all those "no of entries in ..." in control[]
Are these really checked, or even used?

Greetings
Henk

Hi Lonny!

LP>I need a functional binding for appl_search()
LP>Anyone have one, or can point to some place to find the proper binding?
This one is from my own AES binding I use for my TSRs. The parameter aespb is only used to for setting the global array (which I need in the TSRs).
Normally you won't need that unless your binding shall be reentrant...

```
-------------------------------- >8 schnipp 8<
--------------------------------
extern int applsearch_control[];    /* = { 18,  1, 3, 1, 0} */

int appl_search(AESPB *aespb,
                int ap_mode, char *ap_name, int *ap_type, int *ap_id)
{
AESPB aes_pb;
int intin[1];
void *addrin[1];
int intout[3];

intin[0]  = ap_mode;
addrin[0] = ap_name;

aes_pb.pb_control = applsearch_control;
aes_pb.pb_global  = aespb->pb_global;
aes_pb.pb_intin   = intin;
aes_pb.pb_intout  = intout;
aes_pb.pb_addrin  = addrin;
aes_pb.pb_addrout = NULL;

_aes(&aes_pb);

*ap_type = intout[1];
*ap_id   = intout[2];

return(intout[0]);
}
-------------------------------- >8 schnapp 8<
--------------------------------
```

Bye

Hi Henk!

HR>control[]={18,0,1,0,0}
HR> which is probably wrong
It's definitively wrong

HR>and should be
HR> control[]=18,1,3,1,0}
Correct

HR>We go to great lengths to fill in all those "no of entries in ..." in
HR>control[]
Pushing 5 ints at each call is really nothing.

HR>Are these really checked, or even used?
They are needed to for call extensions. for example Atari could have used the function number of fsel_input() to implement fsel_exinput(). They only had to check wether there is the additional parameter in the addrin array.
And with setting of the values for the output arrays you tell the system the minimum size of the array. If a call's return values are extended by some new ones the system can determine wheter it is allowed to place these values there

The only problem with that is, that there are many bindings that do not properly fill the control array. But that's no reason not to do it correctly

Bye

Your descriptions is a bit vague!

Basically, if you use dynamically allocated variables then the space
is obtained from the system free memory. If you are using GemDos
Malloc each call should be noticable with a memory watching tool,
whereas if you're using stdio malloc/calloc/realloc then for
performance reasons they only tend to do a Malloc every so often (when
they have to).

Now, if your program is slowly (or not so slowly) eating away at the
free memory without reaching a kind of "maximum" then it most likely
has a memory leak. This is nothing more complex than your code has
allocated memory and hasn't deallocated it when done with it.

This will leak...

```
typedef struct     {
char *search_text;
...
}    DB_SEARCH_REC;
```

```
DB_SEARCH_REC*
SearchDataBase(char name[])
{DB_SEARCH_REC    *dbr;

 /* no error checking for clarity! */
 dbr = malloc(sizeof DB_SEARCH_REC);
 dbr->search_text = strdup(name);

 /* do search */

 return dbr;
}

int
SearchMyList()
{char    *list[]  ={"fred","jim","bob",NULL};

 for (i = 0; list[i]; i++)  {
     if (SearchDataBase(list[i]))    return 1;
 }
 return 0;
}
```

...whereas this doesn't...

```
int
SearchMyList()
{char         *list[]  ={"fred","jim","bob",NULL};
 DB_SEARCH_REC    *p;

 for (i = 0; list[i]; i++)  {
     if (NULL != (p = SearchDataBase(list[i])))    {
          free(p->search_text);
          free(p);
          return 1;
     }
     free(p->search_text);
     free(p);
 }
 return 0;
}
```

I used strdup() because it is one function that uses malloc. It is up to you to free() it when done. There aren't many of them (tmpnam etc are the only others I can think of offhand) but do make a point of checking the docs on functions that give you data "out of thin air" iyswim!

Hope that gives you an idea of what to look for. ;-)

Hi!

In article <37736084.87617BC2@elektryk.ie.pwr.wroc.pl>,
     Rafal Kawecki <kawecki@elektryk.ie.pwr.wroc.pl> writes:
>   bla = Malloc(sizeof(options));

Better use the library's malloc(), not the GEMDOS function. TOS's GEMDOS has a limited pool of memory handles, so calling Malloc() too often can cause it to stop with an error message. Under MiNT, with active memory protection, each call to Malloc() allocates a block that fits a 8k boundary (the page size used), so Malloc(1L) will actually allocate 8K.

The C library's malloc() allocates larger chunks via Malloc() and then uses an internal management to split these into the blocks requested by the user.

> OK. While executing function 'search' computer uses more and more
> memory!!!!

Well, as your search function itself does not contain any [Mm]alloc()-calls, there's either another part in your program that does so, or the implementation of strcmp() in your C library is totally broken.

Have you tried tracing the GEMDOS calls via Sys-Mon, to see if, when, and which process calls Malloc()?

> BTW. How can I subscribe this list (give the email adress)?

As Nicholas already pointed out, this is a newsgroup, not a mailing list. If you want answers, read them here, there's no need to subscribe anything but comp.sys.atari.programmer in your newsreader (apparently Netscape Communicator). Asking for private replies only is commonly disliked in the UseNet, btw.

Ciao

Thomas

OK. I'll try with malloc.

What you mean broken?This part with Malloc() is used only ones (at the
beginning of my program).

> Have you tried tracing the GEMDOS calls via Sys-Mon, to see if, when,
> and which process calls Malloc()?

Yes. I used PureDegugger, and I know that malloc is called only on start.

Thanks

Newsgroups: comp.sys.atari.programmer

I'm having problems launching .TTP and .TOS programs with Pexec from
within a GEM application under Geneva. The programs run fine and the
GEM application returns correctly, but after that, any attempt to run a
program from the desktop results in a severe crash. I don't have that
problem when launching another GEM application, so I must be doing
something wrong when clearing the screen etc. that causes a GEM error.

This is what I do:

```
    v_hide_c(vdi_handle);
    graf_mouse(M_OFF,0);    /* to make sure */
    v_clrwk(vdi_handle);
    v_enter_cur(vdi_handle);
    appl_exit();

    Pexec(0,prg,param,env);

    ap_id=appl_init();
    v_exit_cur(vdi_handle);
    v_show_c(vdi_handle,0);
    graf_mouse(M_ON,0);
```

It only causes problems under Geneva.

If it is plain TOS applications you are starting you do not need
to do appl_exit().

If you like to keep the appl_exit do it like this:

```
    graf_mouse(M_OFF,NULL);
    v_clrwk(vdi_handle);
    appl_exit();

    Pexec(0,prg,param,env);

    ap_id=appl_init();
    graf_mouse(M_ON,NULL);
```

Someone may give you better advice, but for dynamic memory allocation
why not use calloc instead of Malloc. That's what it is designed
for. Then use "free" to release that memory when you are done with
it. That always works fine for me.

I'm not at all sure about entering and exiting text mode! I have a
philosophy - the less code you write, the less there is to go wrong.
Why not...

```
graf_mouse(M_OFF);
Pexec()
graf_mouse(M_ON);
```

...? ;-)

Hi!

Thanks for all suggestions.
The real problem was STRDUP.
It uses the malloc function and now I solved that problem :)
After using strdup I have to use free() or instead of strdup
it is possible to use strcpy.

Read again. I wrote that either your library's strcmp() function must be
broken (as it seems to call Malloc()), or you haven't really shown as
all the code or how it's actually (going to be) used.

> Yes. I used PureDegugger, and I know that malloc is called only on start.

Pure Debugger is not the right thing to use here for the first stage,
you need a system monitor that traces GEMDOS calls, first. Furthermore,
what you "know" is not what really happens, so an inspection with e.g.
Sys-Mon should help to track the problem down.

Ciao

Thomas

Newsgroups: comp.sys.atari.programmer

Hello all, on advice from Tony Greenwood, who told me this is where this message belongs, here is information about the the first anual MGC99.

The Goal:

The goal is to create the best possible conversion of a classic game. Possible conversions can range from Asteroids to Elite Frontier. Some examples for real classics can be found at http://bengy.atari.org/list.htm. The catch is however, that the game must be created to run perfectly under MagiC (TOS/MiNT support of course not excluded) in a GEM window.

The judges will be the Atari community. All entries will be available for download on December 5th, 1999. At this time, voting sheets will be made available to the general public. The winner(s) will be notified on Christmas Day, December 25th, 1999. This means that all nominations must be recieved by December 24, 1999.

The Prizes

General Prizes:

First, Second, and third place winners will all recieve the upcoming N.AES 2.0. The first place winner will also receieve the latest PAPYRUS OFFICE.

First place: *Atleast* 250$ American In Cash and Prizes
Second place: *Atleast* 150$ American In Cash and Prizes
Third place: *Atleast* 100$ American In Cash and Prizes

Thanks to AtariComputing Magazine, Every applicant will recieve free magazine(s) and/or renegade CD's!!

We are working very hard trying to get a prize for all entries. Producing a game is a very long and difficult proccess, and we believe every attempt at it should be recognized!
Further sponsorship might possibly add more prizes to this list.

The Rules:

* All interested programmers and/or groups which feel that they might be interested in entering this competition must e-mail one of the organizers (Bengy Collins, Jan Daldrup) and confirm their registration. Remember, registration is free, but we need it in order to set up prizes and determine if this competition should be cancelled or not. The Entry deadline is September 15th 1999! NO REGISTRATIONS WILL BE ACCEPTED AFTER THIS DATE.
* The new system calls in NVDI can be used only as enhancements to the game. The game must be fully functional on bare (Standard) MagiC configurations. However, the game is allowed to take advantage of system extensions as long as the extensions are freely available. Example: BubbleGEM
* The game must either be shareware or freeware. However, if the shareware path is chosen, the game can not be crippled in any way.
* The game must come with documentation. ST-Guide and Text versions are acceptable.
* Game control will be one or more of the following: Keyboard, Mouse, Joystick, Joypad.
* GEMJing can be used for sound output.
* The game can not be officially released until Competition judging (December 5th, 1999). Games which are released before the end of the competition and games which already exist are disqualified.
* Any individual or crew may submit as many programs as desired.

The Deadlines!
Entry Deadline (All this requires is an e-mail!) September 15th, 1999
Competition Closes on December 5th, 1999. All Games must be received by this time!

Sponsors

This contest would not be possible if it were not for:

Woller GmbH for 3 copies of N.AES 2.0 (approx 200$)

ROM Logic for Papyrus Office (150$)

M.u.C.S for almost $200 in software

Atari Computing Magazine!! (Willing to give as many copies/cd's as there are entries! Wow!)

June Audio for sponsoring 6 Radium CDs (Radium CD's include tracks from dexter.d and m.pire (produced

with Ataris), raytraced animations, a comic, paintings, starmaps and
more. Each CD is worth about 22$)

If you want to enter, just send us an email (or use the form on the
official contest pages) telling us your name and which game you might want
to do (If you know ..)

Does anyone have any info on the DRI Library files?

Specifically I need to know the format of the *.NDX files.
Any docs or source code would be most help full.

I have found a program called make_ndx.prg but I'd like to make
a new one if at all possible.

Thanks...

I have no docs. You can try to find the original Sozobon distribution (v1)
there is a compiler, assembler, linker and ar program, all with sources.
I have no URL.

It is old, but so is the DRI format.
If there is no URL, I can make a zip file for you.

Henk.

Dear experts,

On a number of postings, I see people referring to the ST's printer port
as being bidirectional.

I have seen a number of DIY electronic circuits designed to be connected
to PC printer ports to allow interfacing of the computer with the outside
world. These obviously transmit to and receive data from the PC printer
port.

I want to know whether it is feasible to use these circuits with the Atari ST (which should be a machine superior to the PCs for which these circuits were originally designed).

I have not been able to see any C or Basic functions which seem to allow reading from the printer port. Am I overlooking something obvious or does one have to be a bit more devious? What function(s) should be called to allow reading from this port?

Greetings from Brisbane in Australia

Eric Kopittke

I don't know nothing about this electronic circuits, but I know something
about
programming.
Well, there is one (maybe 2) functions, which lets you read the parallel port.

This are:
int d;
Bconout(0, d); - output (0 - parallel port)
d = Bconin(0);

I used it with my Falcon030 and it works.

>
There are several implementations on the PC, newer are EPP (enhanced
parallel port) older are write only, so one has to read LptCtrl bits to
read something (4 bits only) and some are bidirectional, like for ATARI.

>I want to know whether it is feasible to use these circuits with the Atari
>ST (which should be a machine superior to the PCs for which these circuits
>were originally designed).

Unfortunately ATARI left out several pins from the 25pin connector, they
should be found somewhere if the circuit needs them. It's possible to
use the extra joystik ports of STE and Falcon, or use a cartridge to
parallel interface. For the latter check my homepage (Ethernet project).

>I have not been able to see any C or Basic functions which seem to allow

I need to check for libs, but ATARI's printer port is connected to the
YAMAHA sound chip, it contains 16 registers that can be read or written to.

Hope this helps a little...

I am sure I can find this on some ftp site.
I had no idea Sozobon used DRI format also, thanks for this info

As I understand it, I may be wrong, the problem with using PC cards with the printer port is the shortage of I/O lines. There are 8 data lines that in theory are birectional but probably need buffering (probably ok for most pico type A to D attachments). There is however only one output line (pin 1 to strobe the printer) and 1 input line(Busy on pin 11 and activated by the printer. The BUSY line goes to the 68901 chip. There is an unused I/O line available on pin 3 of the video connector. This is controlled on bit 6 of port A of the sound chip. The sound chip is a standard Yamaha AY-3-8910 and should be controllable using the equivalents of BASIC's PEEK/POKE commands, or even a machine code subroutine.

However if the card needs an address you could hard wire the address lines to permanently select it, but you'd only be able to use one card at a time It really depends on how many lines the card needs to render it operable.

(All the cards I've used have been simple to use, all you do is use an IN statement to read the data & an OUT statement to set the port. It will be a little more difficult with the ST as the the will need to be configured either for input or output using the appropriate registers on the sound chip. Quite simple but tedious)

Hope this is as incomprehensible to you as it is to me :-)

If I can help/confuse you further let me know

Regards

Mike Bedford

I recently bought a puzzle for $15. I'm not much one for puzzles, but this type I like....

It is a Atari TT, and this is what I've got so far....

"An Atari TT030 computer that is DEAD, NON-WORKING, INCOMPLETE, being sold FOR PARTS. Is missing keyboard, floppy drive, TOS ROMs, Hard Drive, Hard Drive Mount/shell, and a few other chips/components. Also does NOT inlcude any cords, mouse, or other cables. *Does include* the 68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. While there may be a chance that this computer could be fixed, I am selling it as a PARTS MACHINE ONLY."

Alright, the way I see it, the parts list is looking like this:

Missing list:

keyboard - I have a Mega ST keyboard. Would this be compatible?
floppy drive - No problem.. common.
TOS ROMs - Possible problem... anyone know of anyone who burns these?
Hard Drive - no problem.. common.. though the cables from the motherboard to the hard drive might be a problem.
Hard Drive Mount/shell - One could be fashioned to fit... might be

challenging.
and a few other chips/components - again, possible problem, since
more than likely these chips taken
were probably rare. Anyone deal
in ST/TT components?

cords - From computer to monitor/hard drive.. little problem
mouse - absolutely no problem.
other cables - "other" cables? Internal? Possible problem.

As for what's included... "68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. "

I'm relieved that the processor is there, and power supply... my only question is how good the motherboard and power supply is.

So these are the parts of the puzzle. I'm curious to sources for TT computer components, and where I can find specs so I can know what other parts I need to look for.

Thank folks for your helpon this savenger hunt!

Doctor Clu

Well, that depends mostly on who's reading it, now doesn't it ? ;-)

I do recognize this problem very well, and it is usually due to a
problem with the system hardware. Switching rez in ways unexpected
by the system can cause loss of sync between MMU, which scans the
screen RAM, and GLUE, which generates the physical timing signals

that controls the SHIFTER. In an STe the functions are integrated
into chips slightly differently from in an ST (which I know best)
but I do know that the same problem exists there.

The real cause is probably that the SHIFTER lacks a reliable way
of sensing that a new scan line is starting, so that bitplane
counting should restart from scratch. It just keeps counting in
an eternal cycle, and if a rez switch happens to come in the
middle of a sequence that's just too bad. It will lose sync.

This leads to the shifter using the wrong words for each plane,
and can also lead to horizontal shifts of the picture. The latter
can even happen under monochrome rez, where only one bit plane
exists.

Ways to avoid this depend on finding a way to switch the rez with
100% consistent timing relative to the hardware activity. That is
hard to achieve though, so another trick is to do the switch some
times in succession, back and forth, so that any consistent error
in timing gets compensated for.

You could use Timer-A instead. It's possible to set the DMA-playback to

call a Timer-A interrupt, after the playback has finished. That way you
won't get any samples chopped.

Use Xb-timer() (I think it's called that, anyway), to install your
Timer-A interrupt handler, then enable Timer-A by using Jenabint().
Finally when you start the playback (I don't remember by which function
though), or maybe it was when you set the playback buffers, there should
be an option somewhere to make the computer call Timer-A after playback.

I've managed to do this in assembly-language, and I actually had to use
direct hardware access instead of xbios, so there's no guarantee that
the above will work.

Regards
Henrik

This is actually just a guess, but the FDI is connected to the falcon
through the DSP-port, right? Then it would just be a matter of
connecting whichever part of the sound system you want to the 'EXTernal'
port, because that's what the DSP-port is called. This connection is
made in the switch matrix of the sound system, using Devconnect().

If you want to send data out through the DSP-port from the DSP, then you
need to connect
'DSP XMIT' to 'EXT' by using the Devconnect()-call in the xbios. Also
don't forget to call Dsp-tristate() to connect the output of the DSP to
the switch matrix, otherwise you won't hear a thing.

In the DSP, you need to configure its Port C to SSI-mode (in the Port C

Control Register, PCCR). Also the CRB need to be set to: 16bit, 2 channels network mode. For doing this the "DSP56000/DSP56001 User's Manual" from Motorola is highly recommended, I don't recall the exact values to write to these registers. Of course that "16bit" may be changed to 8, 12 or 24 instead.

I have no idea if there is more to it than this in order to send data through the FDI. I don't know if there is some special stuff you have to do, but I can't imagine anything.

Regards
Henrik

I think doing the switch during the vertical blank should be as close as possible to the 100% consistency.

Hi all,

For anyone how as seen Mega disczine then you are more than welcome to join out mailing list. Please see my site at ....

www.mega-disczine.freeserve.co.uk

Please find at the base of the main screen the subscribe box. This is my "new" site and is still undercostrucion, if you find any broken links you can try my old site at....

www.users.zetnet.co.uk/mega.disczine/

You should also find the first 3 issues of Mega on my new web site.

Rather a lot of people have had problems regarding issue 1 and issue 2 in relation to the mouse and keyboard not responding or they were unable to unpack the files correctly to the floppy. This list will come in useful to anyone who has had such problems. Issue 3 was corrected in all these matter but going by the amount of "complaints" in running issue 1 and 2, this list should help you all out.

Due to a problem with my PC (yup I'm a bad boy arn't I ?!?!) I lost most of the files which had been linded up for the next issue. This of course means that issue 4 will be released a little latter than was expected. If you would like to contribute anything at all then please feel free to E-mail me , or post your comments to the mega list.

We are currently planning a STOS "quiz" in the near future. Most of these will be simple projects to help beginner problem solve and get used to how all the STOS commands are used. The first "tutorial" is underway at the moment and most STOS users should be able to solve the puzzles we set to you. Its for fun, advanced uers can also join for the fun as well if they wish , though you may not be interested in the beginners tutorials at this time.

Once the list is setup and running how we want it , with more users also we already have a handful of users already even before this post) I'll start to post the files. These files are only simple (small) files so you should not have to worry about long downloads. You will receive 1 zip file

which will contain 2 files, one will be the STOS .BAS file for you to work with, the other will be a compiled .CMP file which will be the working code which you must make the basic program do. Once you think you have done it you can post back to me your ammended files for evaluation. I will also be posting on the list things like the "top ten fastest coders" . Ok, maybe its not fair to people who don't have much free time but we can work this out at a later date. Should anyof you need any extra help then just post to the list and I'll help you, others users will also be able to see what everone else write so we can all learn as a group.

As said before, its for fun and to learn STOS. You can subscribe and unsubscribe anytime you wish. If you need any further information of questions then please E-mail be.

Keep STOSing....

Chris.swinson@zetnet.co.uk

Correct, but it is not so easy to know exactly when that will be, except by disabling all interrupts, and that can not be tolerated for any long periods of time (max 100 microsec IMHO, which is not enough).

Just calling XBIOS Vsync is not effective, as that only ensures a delay, not that return to the calling code will be in a specific time slot relative to the Vblank edges.

Hmmm, perhaps a temporary patch of the VBI exception vector is the best way to (almost) make sure of it.

Something like this (as written for my DevPac libs):

```
;-------------------------------------
main_code:
        move.b  #wanted_rez_code,switch_rez ;choose wanted rez
        xbios   Supexec,switch_sub(pc)      ;set wanted rez
        bsr     mainwork                    ;work in wanted rez
        xbios   Supexec,switch_sub(pc)      ;restore original rez
        rts                                 ;return to caller
;-------
switch_sub:
        move.b  (hw_rez).w,d0           ;d0 = rez code from hardware
        and.b   #3,d0                   ;mask off unimplemented bits
        cmp.b   switch_rez(pc),d0       ;check if wanted rez is active
        beq.s   .exit                   ;if lucky, exit directly
        move    sr,d1                   ;d1 = sr  (get interrupt mask)
        ori     #$0700,sr               ;disable interrupts
        move.l  (ev_VBI).w,old_VBI_p    ;link XBRA struct to old code
        move.l  #new_VBI,(ev_VBI).w     ;install the new VBI code
        sf      switch_flag             ;clear a flag to be set later
        move    d1,sr                   ;reenable interrupts
.wait_for_it:
        tst.b   switch_flag             ;done yet ?
        beq.s   .wait_for_it            ;loop until switch done
        move    d0,switch_rez           ;switch_rez = old rez
.exit:
        rts                             ;return to caller
;-------
new_VBI_XB:
```

```
        dc.l    'XBRA','RezS'           ;XBRA magic and identifier
old_VBI_p:
        dc.l    NULL                    ;XBRA link
new_VBI:
        move.b  switch_rez(pc),(hw_rez).w   ;SWITCH REZ
        st      switch_flag                 ;tell switch_sub it's done
        move.l  old_VBI_p(pc),(ev_VBI).w    ;restore old VBI handler
        move.l  (ev_VBI).w,-(sp)         ;push ptr to old handler
        rts                              ;and let it do its usual work
;-------
switch_rez:
        dc.b    0       ;byte variable = rez code for next switch
switch_flag:
        dc.b    0       ;byte variable = switch completion flag
;-------------------------------------
```

This method should work for all cases except where some higher interrupt manages to delay the first instruction at new_VBI above. That should not happen often, and will probably not cause any error anyway, as such interrupt routines should execute very quickly (to avoid system errors).

Hmm, Perhaps this could even fix the syncing problems I had in LaceScan.

Hello,

I'm looking for a Atari asm tutorial and some examples
to create sound, graphics, ...

Apart from several commercial-but-freely-downloadable assemblers,
can one obtain a GNU/freeware assembler ?

BTW : has there ever been a book written, tailored to the Atari, about
this ?

regards,

Geert

Hello there

I'm writing a screen saver (with GNU C under MagiC 6.x on a TT) and now
I'm looking for a way to ask all running apps to redraw their windows. I
wrote the following code to send a redraw message to all owners of a
window but none of the supposed receivers does any redraw. It seems as
if they don't receive any message from me.

```
   wind_get(-1, WF_TOP, &wind, &owner, &wind_below, &wind_above);
      while (wind != -1)
      {
         wind_get(wind, WF_OWNER, &owner, &stat, &wind_above,
&wind_below);
         m[0] = WM_REDRAW;
         m[1] = gl_apid;
         m[2] = 0;
```

```
         m[3] = wind;
         m[4] = sx;
         m[5] = sy;
         m[6] = sw;
         m[7] = sh;
         appl_write(owner, 16, m);
         wind = wind_below;
      }
```

Another question: wind_get() with WF_OWNER is recognised only by AES
4.00 or higher, what method could be used to retrieve the same
information under older versions of AES (for example Single TOS)?

>information under older versions of AES (for example Single TOS)?

I use AES form_dial for such things, and that works fine in all TOS.
Essentially I use a box that covers all of screen (except menu), and
that causes the AES itself to send update messages to all APPs that
have any windows on the visible screen.

Here is a code example from my devpac libs, that should give you an
idea of what I mean.
;-------

```
     gem_aes  wind_get,#0,#5         ;ask for desktop area info
     move intout+2(pc),zz_wx ;copy X
     move intout+4(pc),zz_wy ;copy Y
     move intout+6(pc),zz_ww ;copy width
     move intout+8(pc),zz_wh ;copy height
     gem_aes  form_dial,#0,#0,#0,#0,#0,zz_wx,zz_wy,zz_ww,zz_wh
     gem_aes  form_dial,#3,#0,#0,#0,#0,zz_wx,zz_wy,zz_ww,zz_wh
;-------
```

It is always best to let the AES itself choose which messages to use, as that ensures that it will be done as best adapted to that AES.

NB:
I have seen some programs use only form_dial(3,...) to do this kind of thing, but with severe compatibility problems. Such calls should always be paired with some preceding form_dial(0,...) for exactly the same area. Otherwise parts of AES, and/or loaded AES enhancers, may become very confused as to what is going on.

Simple question really, I've a TOS program that is called using the following call:

ret=shel_write(1,0,100,name,cmd_line);

The problem is, if there's any error value returned, I don't see it and the calling program doesn't know anything about it. What I want to know is, is there a way of getting at this return value?

The GEMDOS return value is submitted by a CH_EXIT (90) message. msg[3] is the
id of the terminated process, msg[4] is the return value

>Another question: wind_get() with WF_OWNER is recognised only by AES
>4.00 or higher, what method could be used to retrieve the same
>information under older versions of AES (for example Single TOS)?
```

Snippets from SdTidyUp ...

```
 wind_get(WH_DESKTOP,WF_WORKXYWH,PRECT(desk));
 menu_bar(menu,1);
 menu_bar(menu,0);
 form_dial(FMD_START,1,1,1,1,desk);
 form_dial(FMD_FINISH,1,1,1,1,desk);
```

I noticed that the desktop can't always be convinced to redraw its menu bar. Hence the above kludges in a temporary (blank) one, thus forcing the desktop to replace its own when it is removed.

Hi Guy!

GH> form_dial(FMD_START,1,1,1,1,desk);
GH> form_dial(FMD_FINISH,1,1,1,1,desk);
IIRC it's only documented that a single form_dial(FMD_FINISH) will produce a

redraw. A possible problem with your version might be that the AES or a tool may catch these calls, buffer the area at the form_dial(FMD_START) and simplyreplaces it at the form_dial(FMD_FINISH)

'ret' only fails here if shel_write fails (to launch the program or
something).

Your app will be sent a message when the child terminates - CH_EXIT.
The return code is in one of the message buffer entries.

Can anyone tell me the relative merits of the two versions of C? I
understand that Lattice 5.5 is more or less standard for
English-language programmers, but how does Prospero differ? Does it have
any advantages at all?

The reason I ask is because I bought (used) copies of both (due to a
misunderstanding with the vendor) and am wondering whether the Prospero
is worth keeping or whether I should try and sell it.

That's exactly what you want. If you omit the FMD_START the AES may
attempt to release an area it hadn't actually reserved. Better to
waste a little bit of time rather than introduce an unknown factor!

GH>If you omit the FMD_START the AES may attempt to release an area it
GH>hadn't actually reserved. Better to waste a little bit of time rather
GH>than introduce an unknown factor!
That's not a matter of time.
If there is a tool that buffers/restores the area when doing a
form_dial(FMD_START/FMD_FINISH) you will get no redraw because the "wrong"
content of the area will simply be saved and then restored. If the
form_dial(FMD_START) is missing there is no chance to restore the area from a
buffer, so a redraw must be sent

For what it's worth, when I bought my copy of Lattice, I gave
away Prospero. Prospero's not nearly as powerful as Lattice,
lacks a number of features, and uses a very odd format of make
file. But, Prospero's editor is much better.

>buffer, so a redraw must be sent

That's why a tool shouldn't do it. It has no way of knowing where its
buffer relates in comparison with everything else on the screen. To do
it this way would require it to interrogate the window pile so that it
only restored the bits of itself that would be visible by the time
everything else had finished redrawing [wot a long sentence!] ;-)

If it were to do all that it may as well wait for a WM_REDRAW.

Besides, it couldn't actually use such a technique. The AES can be
particularly stupid - it'll not always pass exact sizes for redraws.
Sometimes they are bigger than necessary.

For its time it was good. It uses the same environment as their Pascal compiler (I have both). Their Pascal was an extremely good implementation at the time - far better than the poly mainframe!

If their C had caught on it would probably be every bit as good as Lattice but it didn't and it isn't. The debugger is good (for its time), being the same as the Pascal one.

I haven't a clue about the quality of its code generation. What really matters is its Atari libraries. Old and out of date. It is of course possible to update them. I did toy with the idea of binning the lot and recompiling all my MWC ones (for which I have all the sources). Would have been a satisfying exercise but of no practical value.

>The reason I ask is because I bought (used) copies of both (due to a

Keep Lattice.

General question to everybody ...

Don't suppose anybody ever hacked the ProC IDE to prevent it moaning
about what rez it is in? [only likes high and medium, probably looking
at Getrez()]

That's not neccessary. form_dial() is only used for modal dialogs where you
have to lock the screen with wind_update(). And if the screen is locked no
other application can change it's content. It really is no problem to save
the dialog background before drawing it and restore it for erasing it before
unlocking the screen

Bye

Joerg

Hi,

I think you still can order the Motorola reference and user's manuals (I have them all, and they are very useful). They are usually free of charge and shipping as well. Here's the titles of books that you may want to look into. I've included Motorola's "product id" too.
I think you can order them online at Motorola's website, and as I said, I think they still are free.

M68000 8- / 16- / 32-bit Microprocessor User's Manual - M68000UM/AD
M68020 Microprocessors User's Manual - M68020UM/AD
MC68030 Enhanced 32-Bit Microprocessor User's Manual - MC68030UM/AD
M68040 Microprocessors User's Manual - M68040UM/AD
M68060 Microprocessors User's Manual - M68060UM/AD
MC6881/MC68882 Floating Point Coprocessor User's Manual - MC68881UM/AD
M68000 Family Programmer's Reference Manual - M68000PM/AD
DSP56000/DSP56001 Digital Signal Processor User's Manual - DSP56000UM/AD

All the best,
Daniel Hedberg

That's absolutely correct Guy.

There are several AES enhancers that get seriously confused if these calls
are not used correctly in 'pairs' as described above.

But any tool which attempts to buffer window areas in such a primitive way
is itself in error doing so. The correct way to redraw a window area is
to let the AES send window update messages to the APP that owns the window.
And ensuring that this is done correctly is the main purpose of form_dial
function calls, and that is why they *must* be 'paired' correctly.

AFAIK it is not legal for an APP to 'release' an area without first having
'reserved' that same area.

Hi Ronald!

RA>But any tool which attempts to buffer window areas in such a primitive
RA>way is itself in error doing so.
Why?

RA>The correct way to redraw a window area is to let the AES send window
RA>update messages to the APP that owns the window.
The AES could use the buffer method too!
What do you think why there ist form_dial(FMD_START)? Just for sending a
redraw message form_dial(FMD_FINISH) would be enough

RA>And ensuring that this is done correctly is the main purpose of
RA>form_dial function calls, and that is why they *must* be 'paired'
RA>correctly.
The intention of form_dial() is to restore the screen after a dialog was
displayed. To send a redraw message is only one possible way of doing this

RA>AFAIK it is not legal for an APP to 'release' an area without first
RA>having 'reserved' that same area.
IIRC it's documented by ATARI to send a redraw message to all (affected)
applications by doing a single form_dial(FMD_FINISH). And as I mentioned
using a pair for doing so can cause problems

Bye

Joerg

Where can I find some source code for doing popups?

I am aware that the menu_popup call is available from AES 3.30 - but I'd
like to be able to use popups in earlier AES versions.

I tried to write my own, but problems arose when I tried to buffer the
"dirtied" area of screen with vro_cpyfm - nothing got saved, and the
dirtied area of screen remained "dirty" which is not very useful when
called from a dialog box handler, or when popup extends outside the dialog

borders.

(I am using a TT with TOS 3.05, AES 4.1 (singletasking), Speedo 4.1)

The offending code looked something like this:

```
screenram = (width * height * planes) / 8;

if( screen = calloc( screenram, 1 ) )  {
     screenmfdb.fd_addr = NULL;

     fill in memory mfdb

     fill in coord array

     // everything is OK up to here

     vro_cpyfm( vhandle, S_ONLY, coord_array, &screenmfdb, &memmfdb )

     // the memory buffer pointed to by screen var remains empty

     hide mouse
     draw popup
     show mouse

     interact with popup

     fill in coord array #2

     hide mouse
     vro_cpyfm( vhandle, S_ONLY, coord_array2, &memmfdb, &sourcemfdb )
     show mouse

     free screen memory
}
```

Where can I find some source code for doing popups?

I am aware that the menu_popup call is available from AES 3.30 - but I'd like to be able to use popups in earlier AES versions, so that means that I'll have to emulate popup menus.

I tried to write my own, but problems arose when I tried to buffer the "dirtied" area of screen with vro_cpyfm - nothing got saved, and the dirtied area of screen remained "dirty" which is not very useful when called from a dialog box handler, or when popup extends outside the dialog borders.

(I am using a TT with TOS 3.05, AES 4.1 (singletasking), Speedo 4.1)
(It was written in Lattice C 5.60)

The offending code looks like this:

```
#include "0/types.h"   // "uint32", "sint16" ...

#include <stdlib.h>         // calloc

#include <aes.h>
#include <vdi.h>

#include "popup.h"     // prototypes

int Popup( MENU *srcmnu, int x, int y, MENU *destmnu )
{
     GRECT desk;   // desktop rectangle
     uint32 screenram;  // ram needed to buffer dirty screen
     void *screenptr;   // pointer to allocated screen buffer

     sint16 vhandle, d; // VDI handle, dummy var

     // used to open virtual workstation
     static sint16 vwi[11] = { 1, 1, 1, 1, 1, 1, 1, 1, 1, 2 };
     sint16 vwo[2][57];

     // disable call to AES, force all code to "emulate" popups
     // ADVANCE is a label that has not been #defined
     #ifdef ADVANCE
     if( _AESglobal[0] >= 0x330 )
          return menu_popup( srcmnu, x, y, destmnu );
     #endif

     vhandle = graf_handle( &d, &d, &d, &d );  // get AES's VDI handle
     v_opnvwk( vwi, &vhandle, vwo[0] );    // open virtual workstation
     vq_extnd( vhandle, 1, vwo[1] );       // get extendeed info
```

```
    // get desktop work area
    wind_get( DESK, WF_WORKXYWH, &desk.g_x, &desk.g_y, &desk.g_w, &desk.g_h );

    // center popup menu on coordinates x and y
    srcmnu -> mn_tree[ROOT].ob_x = x - srcmnu -> mn_tree[srcmnu -> mn_item].ob_x;
    srcmnu -> mn_tree[ROOT].ob_y = y - srcmnu -> mn_tree[srcmnu -> mn_item].ob_y;

    //rc_constrain( &g, (GRECT *)&srcmnu -> mn_tree[ROOT].ob_x );

    // calculate amount of scrren ram needed
    screenram = ((vwo[0][0] + 1) * (vwo[0][1] + 1) * vwo[1][4]) >> 3;

    // allocate it
    screenptr = calloc( screenram, 1 );
    if( screenptr )  {

Hi!

In article <7jnujdhpd1@newshost.comnet.co.nz>,
     gmiller@inca.co.nz (Gaven Miller) writes:

```
>          v_opnvwk( vwi, &vhandle, vwo[0] );      // open virtual workstation
```

Don't forget to ensure vhandle is non-zero afterwards.

```
>        destmfdb.fd_wdwidth = destmfdb.fd_w / 16; // word width
```

This should be (destmfdb.fd_w + 15) / 16, as otherwise the value gets one too low if the width isn't dividable by 16 (1 pixel already means a word width of 1, not 0!)

```
>        // hide mouse, save "dirtied" area, draw menu, unhide mouse
>        v_hide_c( vhandle );
```

Uhh, do NOT use the VDI calls to influence or query the mouse! The AES has its functions for that, so use them. Grab mouse control via

```
wind_update(BEG_MCTRL);
```

and use graf_mouse() to hide/unhide the mouse, and evnt_button()/_multi() to query position and button states.

Btw, your code is also missing a

```
wind_update(BEG_UPDATE);
```

to reserve the screen for displaying a dialog. And of course, don' forget to free both locks afterwards :)

```
>        vro_cpyfm( vhandle, S_ONLY, &arr[4], &destmfdb, &srcmfdb );
```

Here, I'd re-initialize the screen's MFDB, i.e. srcmfdb.fd_addr = NULL; Maybe that's the reason it doesn't work for you. The rest /looks/ OK, but as I haven't tested it, I can't guarantee I haven't overlooked something.

Another advice: Don't allocate memory for saving the whole screen contents when there's only need to save the area for a small popup menu - on larger displays, you easily end up allocating megabytes for the whole screen!

Ciao

Thomas

Thanks for the response.

Most of what you say is common sense - which I was sadly lacking at the time I wrote the code. I went and bought some more common-sense from my local supermarket today. {[:-)]

> Uhh, do NOT use the VDI calls to influence or query the mouse! The AES

Wouldn't it be OK if they are called in pairs? I call v_hide_c and then do my stuff, and when I've finished I call v_show_c, passing the parameter 1 which means "show it only if the current hide depth is zero".

And, with the code shown, the only way out of the code is via the "cleanup" at the end of it, which unhides the mouse, deallocates the buffer etc.

> wind_update(BEG_MCTRL);

Do wind_update calls nest? AFAIK, they just set and clear a flag.

I already use wind_update(BEG/END_UPDATE) as part of my do_form() dialog handler (from which the popups are called). I know the graf_mouse calls next, but am unsure of wind_update.

> >   vro_cpyfm(vhandle, S_ONLY, &arr[4], &destmfdb, &srcmfdb);

Every call prior to the vro_cpyfm blit into the offscreen buffer was OK while I was debugging, but when I use MON to inspect the allocated buffer, it is still blank after the blit into it - it should have the FL3DBAK pattern (which is nonzero) in it, but no sign in the first 12-16k, even though I blit into the buffer at coord (0,0).

Yes, they do. You can do 50 BEG_UPDATEs and you won't be returning control
until you've also done 50 END_UPDATEs.

>Hi Ronald!
>
>RA>But any tool which attempts to buffer window areas in such a primitive
>RA>way is itself in error doing so.
>Why?

Because it is neither the responsibility, nor the right, of a single utility,
not even of AES as a whole, to handle update of the entire screen normally.

GEM is based on the idea that several different APPs share the screen, and
that each such APP *must* take its own responsibility for updating the screen
areas that are used for the work areas of its windows. The AES itself only
has responsibility for refreshing window frames, desktop background, and to
some limited extent the current menu (responsibility shared with top APP).

Simple buffering of the entire screen is not a part of this concept.

>RA>The correct way to redraw a window area is to let the AES send window
>RA>update messages to the APP that owns the window.
>The AES could use the buffer method too!

As stated above, that would be a non-GEM method of implementation. Only a few special screen operations should use that method, such as drop down menus. In any case form_dial(FMD_FINISH) should always result in messages being sent to the owners of windows underlying the specified rectangle.

>What do you think why there ist form_dial(FMD_START)? Just for sending a
>redraw message form_dial(FMD_FINISH) would be enough

form_dial(FMD_FINISH) should cause the same window update messages when used alone, this much is true, but it is still not advisable to use it that way.

The AES can and should use the FMD_START call as a signal to buffer only the parts of the screen that are normally owned by the AES, as stated above. Many AES enhancements link into this call however, and add interpretations of their own, and in most cases these *require* paired usage.

>RA>And ensuring that this is done correctly is the main purpose of
>RA>form_dial function calls, and that is why they *must* be 'paired'
>RA>correctly.
>The intention of form_dial() is to restore the screen after a dialog was
>displayed. To send a redraw message is only one possible way of doing this

Redraw messages are the only legal GEM method of redrawing the work areas of windows belonging to other APPs. For its own windows any APP may use whatever method it pleases (while screen is locked for updating), but not for any other areas. Those must be handled through GEM.

>RA>AFAIK it is not legal for an APP to 'release' an area without first
>RA>having 'reserved' that same area.
>IIRC it's documented by ATARI to send a redraw message to all (affected)
>applications by doing a single form_dial(FMD_FINISH). And as I mentioned
>using a pair for doing so can cause problems

Atari have described separately the use of many functions, which even so are in many cases dependent on being used with other functions. That is the case here too. Putting it differently, the use of FMD_FINISH implies an earlier use of FMD_START. (else what is being finished ?)

Using paired form_dial calls as described can not cause any problem at all in a correct GEM implementation, as the FMD_FINISH call should always result in window update messages for the entire surface of the specified rectangle, or direct restoration of desktop background for those parts of that surface not owned by any APP.

Good point.
Checking error returns should really be done after all function calls that can use such, and far too many programmers just ignore these possibilities.

>
>> destmfdb.fd_wdwidth = destmfdb.fd_w / 16; // word width

Yes, rounding up is very important. Even more so when calculating sizes of buffers that need to be allocated, as any mistake causing those to be too short can cause bombs.

----- snip ----- re: some more stuff on which I simply agree

>Another advice: Don't allocate memory for saving the whole screen
>contents when there's only need to save the area for a small popup menu

For this kind of thing we really should apply the same reasoning that was
used for the design of GEM itself. This means that it is ok to use simple
buffering as long as the surface is a small portion of the total screen,
but if it is larger than a quarter of the full screen then it is better to
handle the redraw needs by AES window update messages.

Hi Ronald!

RA>Because it is neither the responsibility, nor the right, of a single
RA>utility, not even of AES as a whole, to handle update of the entire
RA>screen normally.
Again: why?

RA>GEM is based on the idea that several different APPs share the screen,
RA>and that each such APP *must* take its own responsibility for updating
RA>the screen areas that are used for the work areas of its windows. The
RA>AES itself only has responsibility for refreshing window frames,
RA>desktop background, and to some limited extent the current
RA>menu (responsibility shared with top APP).
Yes, but only if there is something that has to be restored because it wasn'
t buffered before (-> drop down menus)

RA>Simple buffering of the entire screen is not a part of this concept.
No one's talking about the whole screen (in general)

RA>As stated above, that would be a non-GEM method of implementation.
RA>Only a few special screen operations should use that method, such as
RA>drop down menus.
And why is the buffer method used there?
Think back when GEM was developed!
Memory was expensive. For drop down menus the fast redraw was neccessary because the handling would have been much too slow ig it would have been done by redraws. Buffering dialogs would have cost the expensive memory of another buffer. As the speed of restoring the dialog background wasn't that time critical they could use the more cheap redraw method.
IMHO the presence of form_dial(FMD_START) indicates that the buffering was planned or at least DR didn't want to say no to the buffering method in future, when memory would be cheaper

RA>In any case form_dial(FMD_FINISH) should always result in messages
RA>being sent to the owners of windows underlying the specified rectangle.
No, it should result in a redraw (it defines an aim, not a method)

RA>form_dial(FMD_FINISH) should cause the same window update messages
RA>when used alone, this much is true, but it is still not advisable to
RA>use it that way.
AFAIK Atari documented it that way. And this is not advisable then?

RA>The AES can and should use the FMD_START call as a signal to buffer
RA>only the parts of the screen that are normally owned by the AES, as
RA>stated above.
Why should the AES buffer something and the applications cannot?
This would be a too inconsequent design

RA>Many AES enhancements link into this call however, and add
RA>interpretations of their own, and in most cases these *require* paired
RA>usage.
Many software has bugs

RA>Redraw messages are the only legal GEM method of redrawing the work
RA>areas of windows belonging to other APPs.
Yes

RA>For its own windows any APP may use whatever method it pleases (while
RA>screen is locked for updating), but not for any other areas. Those
RA>must be handled through GEM.
form_dial() calls _are_ GEM (even if they are provided by a GEM extension like a utility)

RA>Atari have described separately the use of many functions, which even
RA>so are in many cases dependent on being used with other functions.
RA>That is the case here too.
AFAIK this is not the case here

RA>Putting it differently, the use of FMD_FINISH implies an earlier use

RA>of FMD_START. (else what is being finished ?)
IMHO the documentation of the single use of form_dial(FMS_FINISH) is a hack
by Atari for sending a redraw message to all applications because of lacking
a broadcast. It certainly would have been better to implement a broadcast
insted but that wouldn't have been compatible with the first versions :-(

RA>Using paired form_dial calls as described can not cause any problem at
RA>all in a correct GEM implementation, as the FMD_FINISH call should
RA>always result in window update messages for the entire surface of the
RA>specified rectangle, or direct restoration of desktop background for
RA>those parts of that surface not owned by any APP.
form_dial() is a specification of an interface, not an implementation. And I
don't believe that you can find a documentation of the used algorithm. That's
simply because an interfacec is an abstraction from the algorithm behind it
with the advantage that you can change the algorithm

Bye

Joerg

I'm surprised there aren't more.

I believe the original AES used a fixed buffer for this (perhaps I'm
thinking of the menu buffer - yes probably). Most likely the
"confused" AES enhancers are doing things gracefully via Malloc/Free?

If you feel like implementing it via a window rather than the VDI I
could go dig out the code in Pug. It did it dynamically - created and
opened a blank window, white G_BOX, required number of G_STRINGS
slapped on it.

I've got some VDI "grab/restore selected screen area dynamically" code
lurking about somewhere as well.

which method shall I use to launch another application (from a GEM
application or ACC) that is executed in parallel.
I've tried shel_write(0, ...) and shel_write(1, 1, ...) (MagiC 6) but
nothing happend. I also tried shel_write(1, 0, ...) and then the GEM
application I wanted to launch was started as TOS process after my app
had finished, but this is clearly not the desired behaviour.
I'm wondering which method a desktop uses in a multi-task environment to
launch new applications, because this is exactly what I should use.

Unfortunately, MagiC's way to launch applications in parallel is a bit
different to the way it's done for fully AES 4.x compatible systems.
IIRC, the first parameter has to be 1, the third(?) 100. The parameter
that decides whether to launch a GEM or TOS app has its usual meaning.

If you want, I can look it up.

Ciao

Thomas

Greetings all,

I wonder if it is possible to use the built-in hardware to play notes simultanously, for instance to play chords an such. How can this be done in a way that will work on anything from an ST and upwards?

Thanks in advance,

Joakim

Is this a PC or Atari program? I've already seen a PC prog that'll do this,
but I'm after an Atari executable that'll restore .ST images to floppies.

I'll help test it if this is the case.

My prog is a Atari PRG, it currently has the option to restore .ST files back to floppy. I have tested it out lastnight with a lot of .ST files and it seams to work fine. I'm currently adding a option to read a disc into a .ST image, though this parts only have wrote so far but it should be working later on tonight. I'm just adding a basic shell to it at the moment. If you can help by testing it out to see how well you get on with it then that would be great :)

From my 68000 book,
"suppose that the current interrupt mask is level 3. If a level 5 intrerupt occurs, it is processed and the interrupt mask set to level 5. If during the processing of this interrupt, a level 4 interrupt is requested, it is made pending, even though it has a higher priority than the original interrupt mask.
When the level 5 interrupt has been processed, a return from exception is made and the former processor status word restored. As the old interrupt mask was 3, the pending interrupt of level 4 is then serviced."

hope this helps.

Mark

forgot to answer you question...
from my previous message, an
answer would be

```
interrupt request for level 1 occurs
interrupt mask set to 1
cpu saves sr and pc on the stack
cpu fetches interrupt vector
interrupt request for level 2 occurs
interrupt mask set to 2
int 2 service routine executed
int 2 finishes
int mask set back to 1
continue int 1 service routine
```

The best of the freeware and shareware ones that I've tried is
definitely TOSBox. I'm not sure about WinSTon or PacifiST, since I don't
use them very much.

As for the commercial ones, Gemulator is supposed to be pretty good at

emulation, and if MagicPC is as good as the demo, it's a very good one.
It certainly appears more compatible with a few programs than Magic
v5.11 is.

The best thing to do would be to D/L the TOSBox, WinSTon and PacifiST
v0.48, since v0.49 appears to be rather unstable on my system, and try
them out doing whatever you're going to be doing on it.

You know something, I really would like to get back in the Atari/TOS scene so
"yeah" I love to see something like that!

I have a few questions, one being will the DSP be emulated or could a DSP card
be used? With the way they make the PC's now, I wouldn't be surprised if the
whole thing is done on software :)

Of course I should warn that you may get some opposition from "purists" who
hate any emulation on on Atari/Hades/Milian machine. But then again, you can
just ignore them ;)

Anyways I hope you succeed in this endevior. Maybe I can get back to my own project of running older ST programs under Magic/MINT :)

Eric Noss
a.k.a
Mr. Maddog

Hello Joakim,

I suppose you must "add" the frequences of your notes. The note "a" has the frequence 440
Hz, the octave above it is 880 Hz. The Interval between them is devided into 12 parts for
multiplication. So you can obtain each tone: count the "half-tones" between "a" and the
given tone and calculate 440 * 2^(n/12)!

To add the frequences you must use the sinus and cosinus rules for sin(a) +sin(b)=....!
This function is to be played for the time, where de different tones should be played. For
a ST you can prepare e String for the sound chip and use dosound(), for STE and upwards you
can use the DMA-sound... ;-)

I don't think you should take too much time doing that, because
only few prgs are using the Blitter which is a bit hold and not so fast.
At home, my blitter is always off... NVDI rullez !

|> you can help by testing it out to see how well you get on with it then that
|> would be great :)

Try it out with the Elvira ST files. The MSA2ST converter (PC prog)
fails to produce the correct .MSA file for disk D.
Fetch the *five* ST files from:

```
  ftp -v -n
  open atari.d-n-a.net 8021
  user ftp chris@
  cd automation
  bin
  get A_455_A.zip
  get A_455_B.zip
  get A_455_C.zip
  get A_455_D.zip
  get A_455_E.zip
  bye
```

and run the Elvira intro until disk D is requested and accepted.

That's my way to produce ST disks: convert .ST files to .MSA with
MSA2ST -m FOO.ST on my PC, then copy FOO.MSA on a 1.44MB floppy and
unpack it on my STE. (But NOT with JayMSA, it doesn't work at all.)
You can find MSA2ST on the PaCifiST home page. Maybe the author
provides the source code?

Oh, BTW, I mostly use my PC to run PaCifiST or load digitized tape data
into my ZX Spectrum. ;)

Regards, Jens.

C programmer
in this role you will need to be bright, enthusiastic
 and a flexible college graduate, with some solid
 programming experience in C/Unix. C/C++ on a PC would
 be fine, but a highly GUI focused Visual type
 developer would probably struggle with the
 requirements. The computing skills may have been
 acquired on a formal computing degree course, but
 equally they may have been acquired in the course of
 other study as a necessary tool. Must have had at
 least a year's experience programming to other
 peoples' requirements, although this would not
 necessarily be in a commercial environment. They
 should feel comfortable working with the scientific
 members of staff, developing software requirements in
 the context of a growing understanding of the
 business, technology and science of the company. They
 should be comfortable working on their own or in
 larger project teams.
 The main role will be to elucidate software
 requirements within the scope of the various other
 systems being developed, build prototypes, organize
 user testing and acceptance, deliver finished software
 in a timely fashion with documentation as required,
 and provide support and further development as
 necessary. The main languages will be C running under
 unix and SQL, but there will be many requirements to
 utilize other languages and techniques in the highly
 integrated & automated systems the company will be
 building. There will be opportunities to do data
 modeling.

Technical Skill Set/Years Of Experience - (Required)
(Hardware, Software, Database, Communications...)
1. 1+yr. Exper. Programming UNIX in C to specifications provided by others.
2. Experience In SQL
3. BS degree but programming skills may be acquired in class or "on the job". Additional Technical Skills - (Plus)
1. Exposure to any of the following will be an asset: CGI programming/SQL/perl
2. Desire to be a "team member" in addition to a being an individual contributor.
3. Confortable working with scientific members of staff.

SAN FRANCISCO 80K-90K PLUS STOCK

As Senior Web Applications Programmer for this Company, you will be developing web-based programs using a combination of the following skills: COM, DCOM, Java, JDBC, ADO, Active Server Pages (ASP), JHTML, IIS 4.0 or Java Web Server. You must have at least one of the following in distributed architectures: DCOM/Enterprise, Java/CORBA. Experience in writing professionally-crafted requirements analysis and design documents is also a must.

Minimum qualifications include:
-- BS degree in CS, EE or MIS;
-- Strong written and verbal communication skills;
-- Strong team attitude with a focus on details and client satisfaction; and
-- 4-10 years professional development experience.

As a Web Applications Programmer for this Company, you will be developing web-based programs using a combination of the following skills: COM, DCOM, Java, JDBC, ADO, Active Server Pages (ASP), JHTML, IIS 4.0 or Java Web Server. It is essential that you possess strong written and verbal communication skills, as well as a strong team attitude with a focus on details and client satisfaction. A BS degree in CS, EE or MIS is required, as are 2-5 years of professional development experience. You must know how to author stored procedures using PL/S and/or Transact SQL. Other requirements include 1+ years of solid internet application development experience, and familiarity with Oracle and/or MS SQL Server.

REDWOOD CITY 80K-90K PLUS STOCK

Join a company that is on the cutting edge of

e-commerce. This is an opportunity to change the way
millions of people do business. Company currently has
50 employees and is experiencing explosive growth.
Compensation will includes a very attractive stock
option plan.

In the Web Developer / Software Engineer
position, your duties will include coding modules
according to customer specifications, testing and
documenting code, and designing modules when required.
You must have at least 2 years web development
experience using Perl, CGI, HTTP, HTML, C, SQL and
Windows.
Familiarity with graphics packages--
Photoshop, Illustrator, Debabelizer, HTML--is desired.
You should have a portfolio ready to demonstrate your
work on different sites.

Please apply or call today for more details!

Mt. View Biomedical compnay 70k plus stock
Unix Adminsistrator
If you are bright, enthusiastic and flexible graduate,
and are prepared to work on a great variety of tasks
associated with the development and maintenance of the
company's various computer systems. The main tasks
will be system administration for (initially) all
company systems, which will include Sun unix machines
of various scales, the development and production data
servers, and the company file&print server. As part of
this they will have to develop and maintain effective
data backup and recovery systems. They will be
responsible for provision and support of desktop
computing, both PCs and X terminals (or equivalent),
printers, e-mail, software, etc..
REQUIREMENTS:
1. primary skills will be based around unix system
administration and operation of LANs and internet
connections.
2. at least one years' experience as the key person
running some sort of unix installation.
Exposure to any of the following will be an asset:
3. Intranets/Sybase/Oracle/Novell/network
design/network storage devices.
4. BS Degree (minimum).

As the company grows, this post will evolve, and will
become more specialised, either technically or
managerially, depending on the skills and/or career
development requirements of the incumbent.

San Francisco 80-90k plus stock
DBA Programmer

As a Database Administrator for this Company, you will
assist with their client project as the DBA for their
client server farm. You will be immediately
responsible for helping to make the site as stable as
possible by auditing, creating new, modifying
existing, and documenting all SQL environments, backup
procedures, and monitors. You will ensure that all
data transfers are successfully executed and
monitored, as well as develop and document contingency
plans for these transfers. You will also assist in
properly training and transitioning these
responsibilities to a DBA to be determined by their
client. Once stable, you will then assist in creating
a "Best Practice" Document for use on all other Site
Server Membership deployments. You will then be
staffed on another Site Server Project or leveraged on
database-intensive projects within the Business
Systems Practice.

REQUIREMENTS:
--MS SQL Server DBA with at least two years experience
as a DBA.
--Knowledge of backup, clustering, and performance
tuning.
--Knowledge of MS Site Server and the Membership
Directory preferred
--Experience with other databases, specifically
Oracle.
--Certifications with at least one technology, but as
no substitute for experience.

Hey,

I've recently begun programming my old ST as a
fun side project and i have a small problem.

I run in medium resolution and my program switches to
low resolution, when i come back to medium resolution
it looks like the screen address is off by a plane.
(Eg i see the screen in red/green...)
I know that this description is quite fague, but maybe
somebody knows what i mean...

Does anybody know what's wrong and what i can do to
stop this from happening ?
(It might be usefull to know that I use devpac on an
STe...)

Thanks in advance, Alex...

Yep, it is vague. Fortunately there ain't too many causes! ;-)

>Does anybody know what's wrong

The display chip doesn't care what mode you're in. It just so happens
all three ST modes use 32K of memory. When you change from one mode to
another the chip simply translates the information in that space
differently, hence the wierd display.

>and what i can do to
>stop this from happening ?

Depends on what "owned" the original display - but the best way round
it is not to corrupt it in the first place. When you enter low rez
change the display address to another block of memory. Doesn't matter
where this 32K is, *provided* it is aligned on a 256 byte boundary.
Just restore the original address when you revert to medium rez.
Sumfink like this ...

```
old_log = Logbase()
old_phy = Physbase()
old_rez = Getrez()
d0 = Malloc(32 * 1024 + 256)     //or use static 32K+256 block
if (d0 zero) then rts "not enough memory"
cur_base = d0
d0 = d0 + 256
d0 = d0 $ffffff00
Setscreen(d0,d0,lowrez);
jsr YeOldeLowRezProgram
Setscreen(old_log,old_phy,old_rez)
Mfree(cur_base)
rts
```

>(It might be usefull to know that I use devpac on an

As Brian O'Donnell suggested to me i'm including my code here, it's quite long
sorry for that one....

Maybe there's an error in there someware, i must confess that i stole almost all the code in the routine 'start' from an example.
(and my ST knwoledge is too limitted to really understand it :>)

the routine '_main' that's not included 'draws' to _w_screen and calls '_swap_screen' until the spacebar is pressed...

Thanks in advance, again,
Alex...

I AM modifying the content of the original screen buffer,
but i don't think thats the problem (eg. the GEM windows ARE redrawn).
But it sometimes (75% of the times it workls correctly) looks just
like if you'd copy an image but skipping the first word so all
words are one word too early in the screen buffer...

Hmm, this explanation doesnt help either does it ? ;>

Anyways, i've posted my code in this newsgroup too,
maybe that somebody can find an error in it ?

Alex...

Also try a v_sync before you switch rez.

On the 256 byte screen boundary I tend to do this:

```
 move.l    #screen,d0
 clr.b    d0
```

```
 ds.b 256
screen:
 ds.b 32000
```

the code always ensures the new screen address is on a 256 byte boundary.
Nice and simple.

Agenda for the May 19th, 1999 Toronto Atari Federation meeting:

First, it's time once again for the annual TAF Executive Elections! If you like what the club is doing, or want to see a change in how it's being run, then by all means come in and let your voice be heard! This is the executive you'll be bringing in to the next millenium....

Then, we'll be looking at how to improve the efficiency of your PC computer - by installing an Atari emulator and running your favorite ST applications on it! We'll be looking at GEMulator, TOSBox, PacifiST and other popular ST emulators, running on both a PC laptop and on our PHOENIX editor's PC tower! Learn about how well the various emulators run, the advantages, the pitfalls, the issues on emulation - and what does and doesn't run. Needless to say, this seminar will also allow you to run your programs well into the millenium as well.

It'll be an exciting night, to say the least. See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

Greetings all,

As indicated in the subject line, I am looking for a way to look for
incoming midi events without making the whole program wait. It should
still be able to wait for other instructions.

Thanks in advance,

Joakim

Hello all,
    I have made the plunge into my newly acquired 800XL and want to learn to program on it and I have a VERY embarrassing question.
    How to I save and load from my 1050 floppy drive?
    I have a book on game programming that came with a disk. I typed CLOAD and it started to load, but then I realized that there are most likely more than 1 program on the disk. The disk isn't labeled so I need to know what is on it. How do I find out the names of the files on the disk and how do I load those files (I assume CLOAD then the name of the program)? I assume saving a program is similar.
    I am too used to DOS and Windows...
    Please e-mail me at delliott@nac.net and don't be too hard on me.
    Thanks,
    David
PS I'm sure the same holds true for my 410 program recorder too...

Hi,

I have adapted MPEG2DECODE, a bitstream ISO video 1&2 decoder, to all
ATARI platforms running more or equal to 256 colors. The decoder's
binaries are available at http://eureka.atari.org/mpeg2dec.zip
It works now nicely. But, I was wondering whether someone would be
able to extend the C source code, so that it could decode MPEG
audio included in the stream. I've no idea of what to do, but maybe
someone would do it. The sources have been succesfully compiled
with PURE C 1.1 and GCC 2.8.1 in 16 and 32 bits int modes. There's
more and more MPEG sequence on CDROMs nowadays, and decode them
without the sound is a bit frustrating. Of course there's a need
of CPU power to decode MPEG, but I have an HADES 060, and powerfull
ATARI computers now apear. I think that to decode both Video and Audio,
Audio should be preprocessed, and be played while decoding Video.
I've no idea of MPEG Audio formats, either than the audio stream
included in video, but, my decoder decodes MPEG Audio/Video 1&2
streams without the sound for the moment. If anyone has the ability
to adapt my C sources, I would be glad to send them. Maybe
I could take advantage of MPEG Audio decoders that are available
on ATARI.
Thanks for cooperating ...

Regards,
Bye for now,

I'm not an expert with machine code but the code you've "liberated" <g> seems to be going at it very low level.

Firstly all the _restore_res routine appears to do is simply restore the old resolution. Until such time as something "clears" or otherwise completely redraws that 32K of screen ram then it is going to look wierd.

Secondly, there are lots of registers associated with the video. I personally know nothing about them but I'd be most surprised if the system lets you get away with changing them when you feel like it. This is where I think the problem lies: simply that 25% of the time the change is made at the wrong time and something isn't synchronised. Might even be that no rez change even takes place!

The _swap_screens routine does appear to be toggling between two screen displays. This, coupled with the fact the code totally hijacks the VBL interrupt and runs entirely in supervisor mode indicates (imo) this code is targetted for a "shoot-em-up" kind of game, where fast frame rates are the order of the day. All other considerations come second to this, thus these kinds of games rarely exit cleanly.

>Hmm, this explanation doesnt help either does it ? ;>

oo, I dunno. ;=)

>Anyways, i've posted my code in this newsgroup too,
>maybe that somebody can find an error in it ?

Like I've said, I could be wrong. I'm not expert enough with machine code or direct hardware access to tell. I do think it is the wrong kind of code though. Standard operating system calls can be used for initialisation and termination.

Best go look at the code now ... ;-)

... my money goes on that #-1 value I've mentioned for Setscrn().

>        addq.l  #6,sp
>        move.l  d0,old_ssp       Store old SSP
```

The ST usually runs with the processor in "usermode". It only enters superstate inside the operating system (ie in a trap / interrupt etc). This feature is common to all 68000 processors but the above call is specific to the ST - there is no way you can get into superstate unless the system provides a mechanism to do it.

Some memory locations are inaccessible in userstate (like hardware) and (iirc) the 1st 1Kb of ram. The above call is called "Super()". It allows a userstate program to enter superstate, or to revert back from superstate to the normal userstate. The processor maintains two hardware stacks: one is used in superstate, the other in userstate. Because when one is active the other must be inactive, both are known as "a7" or "sp" - whatever it is your assembler uses. ie the stack in use at any one time can only be known if you know what mode the processor is in at the time.

Essentially what happens above is the system enters superstate and returns the userstate stack. This must be preserved and restored (usually pretty soon but games tend not to) later with another call to Super using this d0 value as its argument.

```
>        move.w  #3,-(sp)         Logbase to find the screen
>        trap    #14
>        addq.l  #2,sp
>        move.l  d0,_d_screen     Store the currently displayed screen
>        move.l  d0,old_screen
```

Logbase() is the address where the system scribbles its graphics. Physbase() is where the video displays its graphics. Normally both addresses are the same but a game usually needs to change them. Typically it'll have two Logbase screens and the Physbase will toggle constantly between them during the flyback portion of the video chip whilst the game draws on the one that isn't currently being displayed. ie flicker free graphics.

```
>        move.l  #w_screen,d0     Create a offscreen buffer
>        addi.l  #256,d0          ensure it's on a 256 byte boundry
>        andi.l  #$ffffff00,d0
>        move.l  d0,_w_screen
>
>        move.w  sr,old_sr        Save status register
```

this is the superstack, or superstate stack pointer cos we're still in supervisor mode (which is where we stay).

```
>* call the main program
>        bsr     _set_low_res
>        bsr     _main
>        bsr     _restore_res
>
>* clean up
>        move.w   old_sr,sr        Restore status register
>        move.l  old_ssp,sp       Restore stack
```

this is where my lack of asm knowledge lets me down. It's dumping that saved userstack right over the top of the superstack to revert back to "usermode" ... or is it? This may be perfectly legal but why can it not call Super(old_ssp) as per docs?

```
>        move.w  #-1,-(sp)   Restore the screen
>        move.l  old_screen,-(sp)
>        move.l  old_screen,-(sp)
>        move.w  #5,-(sp)
>        trap    #14
>        lea     12(sp),sp
```

eek! I'm lost. That #-1 argument doesn't make any sense. Either there's something I don't know or it is definately a bug. That should be the screen mode, -1 values in OS calls are typically used to mean "don't change". I would have expected the initialisation code to have issued a Getrez() earlier then pass the saved value from that as the arg here. Someone else is gonna have to explain this one! Oth iirc "1" is the value for medium rez so it could just be a typo.

```

oo heavy [in a Homer type voice] ;-)

Not really needed if you only want to draw on the same Logbase/Physbase screen ...

```

The commands in ATARI BASIC is as follows:

LOAD "D:FILENAME.BAS" - D is for disk drive, if you have more than one
disk drive then you can use LOAD "D2:FILENAME.BAS" this will load the
program FILENAME.BAS from the second disk drive.

To save a file it is pretty much the same SAVE "D:FILENAME.BAS" etc..

You can also load then run a file by RUN "D:FILENAME.BAS"

By typing DOS you can get a menu of DOS options.

Filenames have the same rules as MS-DOS on a PC, including wildcards.

Disk directory can only be seen by going into the DOS menu and
selecting A.

Hope this answers you questions.

Why not do two processes, one for midi and one for the AES part.

There are no embarrassing questions. We all had to start somewhere.

Firstly. is DOS loaded???
To load dos, turn on drive, instert the disk, close door then turn on
the computer.
you should hear a series of beeps comming from the speaker thenthe
ready prompt.
Anything else like errors or no loading at all means something is not
working.

From basic, enter DOS for the dos menu.
From dos, B to enter cartridge (basic).
From basic LOAD"D:program.ext. where program.ext is the name of the
program you wish to load.
SAVE"D:program.ext saves your program.
LIST"D:program.ext Lists the program to disk.
ENTER"D:program.ext Enters a listed program from disk.

The last two instructions do have a use but are not mandtory.
They are used to clear out the vairable table of unused vairables
because Atari basic can only have 128 vairables.

CLOAD and CSAVE are used for the 410 only.

James.

Yes, in your main GEM app you fork(). Then in the child simply wait for midi bytes using Bconin(3). Under MiNT, the child will be blocked until a midi byte is available.
When you get a byte you can send it to the GEM app using appl_write().

(it will be a little slow. I suggest you to collect a certain amount of midi bytes before sending them)

Vincent

BTW... I have no Atari DOS loaded on here... just the pre-loaded BASIC and I also have the Atari Assembler Editor cart. I have no way of knowing the filenames on the one floppy disk I have.

Right....

the same for LIST and ENTER commands also...

Dalibor

There's basically three ways to do this:

1. Use a very short timer in your evnt_multi()-loop, and poll the MIDI-port using either Xbios or GEMDOS at every time-out. This is the only method that works on all TOS/AES-versions and -alternatives, but thanks to the large overhead in evnt_multi it's not very fast. It's a very common method though.

2. If the OS is capable of it, you can run the MIDI-part in a separate process. Do a fork in the main application, initialize a new application in the forked process (so you can use appl_write) and wait for incoming data (using e.g. Bconin) on the MIDI-port. When something arrives just send it to the main application with appl_write.

   The downside of this is that it's not trivial to use threads this way when you're calling the AES (basically you'll have to use some custom AES/VDI-bindings), and it will only work with MiNT or the very latest version of MagiC (6.2 IIRC).

3. Use AES-threads in MagiC. This is probably the most elegant solution, but it will only work with MagiC (from version 5 I believe, perhaps version 4). They don't differ from MiNT-threads a lot, but they're more efficient. This doesn't mean much in real life though, unless you create threads very often.

It's a pity that GEMDOS can't trigger any events in the AES, this makes GEM-programming a lot harder than necessary. XaAES circumvents this, as it passes events in a pipe which applications can listen to. This means that you can wait for both AES-events and regular IO with a simple select().

Yes I figured it wouldn⍰t be all that efficient. I will consider this
though. It would be great if I could get it to work on all TOS/AES out
there.

This does indeed sound nice, but (as you might know by now :) I do my
programming in GFA, and has no knowledge about calling MiNT from it.

Most of the DOC's on MiNT (and programming over all) is written with
C(++) in mind, and it is sometimes a bit hard to understand if you (like
me) are no proffesional programmer. ;)

Can somebody point me in the right direction to learn about MiNT calls
(from GFA-basic point of view)?

I would appreciate this *very* much!

Regards,

Joakim

Recent versions of MagiC can also do this, so it's not MiNT-specific. But
OTOH, I don't know if it's even possible to write reentrant code with
GFA...

> Can somebody point me in the right direction to learn about MiNT calls
> (from GFA-basic point of view)?

Katherine Ellis is the only MiNT-programmer I know of that use GFA.

Without DOS you can't read a disk, but most pre-recorded disks have some
sort of DOS. First you turn on the drive and insert the disk, then turn on
the computer. If it says "BOOT ERROR", you need to get a DOS disk.

Just a thought...

You could write a DA to handle the midi side. This could then message
your main app (or anybody else's).

>Can somebody point me in the right direction to learn about MiNT calls
>(from GFA-basic point of view)?
>
>I would appreciate this *very* much!

I don't think it is wonderously difficult. I don't know anything about
GFA myself. However, Lonny Purcell got a GFA prog calling an object
library that I wrote in C without too much bother. Seems it can
generate C friendly calls somehow, which is the key.

There's such a thing as a "standard C call". Take the time to
understand this and life will be a lot easier! ;-)

(some C programmers could take note as well - this is the basis of
upgrading your compiler to support new OS calls)

A standard C call is where C passes its arguments on the stack and
gets the function return result in a register. TOS (as opposed to Gem)
is almost identical to this. Given most C style documentation it is
possible to figure out the assembler required to make that Tos call.

MiNT calls will be the same.

Now for the C you hate so much ... ;-)

```
main()
{char    *s   ="wibble";
 int16   d    =1;
 int32   l    =2;

 printf("%s %d %ld\n",s,d,l);
}
```

which when run produces

```
wibble 1 2
```

on the screen (in case you wondered!). Okay, a standard 680x0 C call pushes arguments right-to-left onto the stack and expects the result (if any) to be in register d0. The caller has to pop the stack - that is the function being called doesn't mess with it like in Pascal. In the above main() pushes the args when calling printf() so main() has to pull them off when printf() returns. There are actually 4 args to printf() above. The expected s,d,l but also included is that incomprehensible string that tells printf() how to print s,d,l which we'll call the format string.

Here's some offbeat assembler ...

```
.format_string
     ascii    "%s %d %ld\n"
     byte 0

.main
     //look at the C function, start with the last arg
     //then work left pushing each arg in turn until
     //you reach the first arg in the C function.

     move.l   l,-(sp)            //rightmost stacked 1st
     move.w   d,-(sp)            //work left..
     move.l   s,-(sp)
     move.l   format_string,-(sp)
     jsr  printf
     adda.l   #14,sp             //unstack format_string,s,d,l
     rts
```

Still here? Now we get to the interesting part. Imagine printf() was part of Tos, it would be nearly identical ...

```
.format_string
     .ascii   "%s %d %ld\n"
     .byte    0

.main
```

```
     move.l   l,-(sp)
     move.w   d,-(sp)
     move.l   s,-(sp)
     move.l   format_string,-(sp)
     move.w   PRINTF_OPCODE,-(sp)    //always pushed before trap
     trap some_number
     adda.l   #16,sp            //do PRINTF_OPCODE as well
     rts
```

The difference is trivial. (1) the 'jsr' is replaced by a 'trap'. (2) 'PRINTF_OPCODE' is a word value denoting which call we want. (3) Remember to take into account the opcode afterward when unstacking.

So, if someone says the MiNT call Pdomain() is what you need and tells you it is in GEMDOS and has this prototype ...

```
int16    Pdomain(domain);   //opcode 281
int16    domain;
```

... then you have all the info you need.

```
move.w   domain,-(sp)  //push the word representing 'domain'
move.w   #281,-(sp)    //opcode
trap #1        //gemdos
adda.l   4,sp      //unstack opcode,domain
```

Or Pfork()...

```
int16    Pfork(void);  //opcode 283

              //there aren't any args (void)
move.w   #283,-(sp)    //opcode
trap $1        //gemdos
adda.l   2,sp      //unstack
```

In all cases the return value is in register d0. A LONG, int32 or any kind of pointer takes 32 bits so is in d0.l, whilst WORD and int16 take 32 bits so only take up d0.w (the low 16 bits). Byte sized values are (sign) extended to 16 bit values before pushing them onto the stack.

A standard C call preserves registers d3-d7, a3-a7. This of course means it can (and will) stomp on registers d0-d2, a0-a2 inside the call you are making.

If you can make GFA call assembler you can add any new OS call you want.

Hi!

Guy Harrison <guy@swampdog.demon.co.uk> wrote:
> If you can make GFA call assembler you can add any new OS call you
> want.

Well, for new GEMDOS calls, it's even possible without any assembler.
GFA provides a generic GEMDOS-function, which you pass the function
number any as many parameters as necessary, either as shorts or longs.

For example, calling Fxattr() from GFA may look like this:

```
FUNCTION fxattr(name$, flag&)
     name$=name$+CHR$(0) ! Add the C-style EOS
     RETURN GEMDOS(&H12c, L:VARPTR(name$), flag&)
ENDFUNC
```

(Note that this may not be fully correct GFA code, I don't use it
regularly enough, I'm actually a C programmer.)

AFAIR, GFA even has the possibility to call new AES functions filling
the parameter blocks manually, so this should work, too.

Ciao

Thomas

Hi All,

I'm right in the midst of writing some audio software for the Falcon (before writing an ST version), and I'm trying to figure out how to use the XBIOS function Buffptr(). From what I understand of it, it should allow me to find out when a sample that I have passed to the play buffer, using Setbuffer() has finished, so that I can send it another. But I can't work out exactly what it is that the function requires as the argument...

There seems to be some contradictory information between the Atari Compendium and the Lattice C reference books (this is the compiler I'm using), and whatever I put in, the compiler complains that it's wrong. Apparently, there's some sort of structure that returns something or other, but I'm clueless :(

If someone could explain it to me (in simpleton's terms), or suggest another way of polling to see if the Falcon's finished playing the last sample, I'd be really grateful. I have tried using the system clock, but the timing's not accurate enough, and it chops off the end of the sample!

Thanks in advance for any help offered.

Ah! I knew there was something. Just couldn't remember. :-))

I'm sure there's enough there for Joakim to figure it out.

>Apparently, there's some sort of structure that returns something or other,
>but I'm clueless :(

Buffptr() wants a pointer to 4 consecutive 32 bit values. An array of
4 longs would do but we'll stick with the Compendium definition ...

```
typedef struct     {
VOIDP    playptr;
VOIDP    record;
```

```
VOIDP    reserved1
VOIDP    reserved2
}    SBUFPTR;  //misleading name

foo()
{SBUFPTR  buf; //and here's why, cos I darn well
               //nearly missed the fact I'd typed
               // SBUFPTR *buf; meself!!!

 Buffptr(&buf);
 printf("%lx %lx\n",buf.playptr,buf.record);
}
```

If Lattice doesn't like VOIDP then root round and see if it has a definition for it in one of its headers. If not replace it thus ...

```
typedef struct     {
void *playptr;
void *record;
void *reserved1
void *reserved2
}    SBUFPTR;
```

Others might suggest

```
typedef void* VOIDP
```

but I'd be wary.

>If someone could explain it to me (in simpleton's terms), or suggest another
>way of polling to see if the Falcon's finished playing the last sample, I'd

>not accurate enough, and it chops off the end of the sample!

Different compilers can vary in how they declare certain datatypes.
Although the above will work (Compendium details assumed okay) you
ought to search the Lattice header files and use its definition if one
exists.

I had a lot of trouble with the XBIOS routines when modifying Kay Roemer's
audio device for MiNT.

You might try looking at the sources for this:
http://www.ligotage.demon.co.uk.

But if I remember correctly, I wrote directly to the hardware.

Salut/.

J/.

Hello

The zip files of the Flash.bin are correct now! The problem
comes from st-zip 2.6: you cannot add caracters on a file in the
zip. After it, you cannot use st-zip to deflate ...

The beta version is for 128 MB EDO Ram and a better access to the
cardridge port (for Logic 2.5 and logic audio).

Hi All,

I would like to be able to program using C++ on my Atari
but I am having problems finding a complete GCC setup.

Does anybody know where I can find the latest version
of GCC, complete and with install instructions to run
either under plain TOS or a complete MiNT setup.

Thanks,

Ben Hills.

I've had exactly this problem, but couldn't find a solution I liked (I wanted
user programs to be able to run in supervisor mode).

>Make sure the scheduler isn't called from both interrupts. For instance, if

In my case that wasn't possible since I wanted interrupt routines to be able
to for example signal semaphores (it was a real-time kernel, so it would have
been an error to return to the original task if one with a higher priority
had been awakened).

>the scheduler is only ever called from the 200 Hz interrupt (in an Atari),
>the problem does not arise since the 200 Hz interrupt won't fire again
>before many instructions from the first firing are executed. Other (higher

Unfortunately, that doesn't help.

Say for example that a keyboard interrupt occurs while a user program is
running in supervisor mode. If then a 200 Hz interrupt occurs while the
processor is still running the keyboard code, there's no way to know that
the current processor registers are not those of the user program.
So, the timer interrupt code can't save the process state and therefore not
reschedule!

If the first instruction of the keyboard interrupt had been guaranteed to
be executed before the timer interrupt was allowed, it would have been
possible to avoid the problem.
You wouldn't even have to disable all interrupts in that first instruction.
It would be enough to somehow mark that an interrupt had been entered, since
you can then make sure that only the very first of the nested interrupt does
any actual rescheduling (this requires that the kernel deals with all
interrupts, though).
In my case, I did what I describe above, but I'm aware that it won't work if
another interrupt can indeed occur before the first instruction of the
previous one is executed (d0-d7/a0-a7 will still be the ones from the running
process, but the program counter and status register won't be correct) and
the m68k is supposed to behave that way, unfortunately.
(This kernel is only used in a basic microcomputer/realtime course, so you
 don't have to worry about running into anything that's controlled by it.
 (The problem is also clearly documented.) ;-)

If you don't allow user processes to run in supervisor mode, there's no need

for an explicit mark when entering an interrupt, since you can just inspect
the status register on the stack to decide if it's a nested interrupt.
(That will most likely require that other exceptions (Trap etc) are prepared
 to do rescheduling too.)

I'd very much like to know if there's a way around this problem.

>level) interrupts do not harm since they will clear the stack again before
>execution resumes with your interrupt code.

That's of course true, though.

If you normally run with all interrupt levels enabled, then you can look at
the stacked copy of the interrupt mask. The mask is part of the status
register which is stacked during interrupt handling, so it is immune to

multiple-interrupt problems. If the mask is not zero, you know you are in a nested interrupt handler and should not call the scheduler.

On occasions you may want to disable some or all interrupt levels within the user task, for timing critical sections, or to guarentee atomicity. In this case, you do not want the interrupt to call the scheduler even though the interrupts are not nested. The system described above will work in this case too.

Thanks a lot Jo!

This problem has been bugging me for some time now.
I really appreciate the help, since I needed this feature
badly for a lot of things.

Regards,

Joakim

Hi Peter!

PR>Other (higher level) interrupts do not harm since they will clear the
PR>stack again before execution resumes with your interrupt code.
I think the problems are caused by the lower priority interrupts, because the
scheduler saves their context when they get interrupted by the scheduler

Bye

Hi!

I'm planning to make a device drive for Magic, but I haven't got much
experience with making one, so I need some help! The device will
hopefully be compatible with the serial-devices on MiNT, so that I can
use the Palm Pilot link-software under MagiC too.
I've tried to compile the dev-lpt1 from Andreas Kromke, but I seem to
miss some files (tosref.h and ncstart.o, or something).
So, I'm looking for sources, docs and specs on how to make a MagiC
device driver.
Any help would be greatly appreciated!

Thanks!

Best regards

  Hi Vlierus. Here are a few more:

  comp.sys.atari.st (biggest!)
  comp.sys.atari.advocacy
  comp.sys.atari.st.tech
  comp.sys.atari.8bit
  rec.games.video.atari
  alt.games.lynx
  alt.atari-jaguar.discussion

  IMHO, if you just post your announcements to comp.sys.atari.st, you'll
  get the largest results... ;-)

Yes indeed!

After a lengthy hiatus, the newsgroup comp.sys.atari.announce is
back. I have taken over as moderator, and just approved a posting, the
group's first in years.

I plan to update the group's charter, and will work with the Atari/Usenet
community to make the newsgroup as useful as it can be. c.s.a.a will be a
low-volume newsgroup offering news about Atari software, hardware, Web
sites, and other information relevant to Atari users. Articles may be
related to Atari 8-bit, ST, Portfolio, and PC clones.

I would appreciate your help in getting the word out about
comp.sys.atari.announce -- after such a long lull, I'm sure many
Atari-loving newsgroup readers have forgotten about this newsgroup. Of
course, I also invite folks to post any Atari-related announcements to the
group.

Never found one on the net.
Now I use the Mint98 CD and have installed Mintnet with all bells as
: sources, libs and compiler.
That set works.
Also in the old PD-library of the Dutch Stichting ST the have a very
old setup ready to run divided over 7 floppydisks.

I am looking for *ANY* STOS coders out there, no matter if you are a expert
or compleate novice I would like to here from you.

If you need help, wanna swap ideas or playtest programs then mail me now.
I've already collected a handful of people so where are all the other coders
out there ? There must be loads of you people out there somewhere ???

If you know of any good STOS mailing lists then please mail me the info to
join :-) Any good STOS sites or even Atari sites then please let me know !!
I'm also looking for any FTP sites with anything Atari related on there.

So come on guys where are'ya all hideing ?

Chris

If you've written any STOS programs, they MUST be your OWN material, why
not send them to me. If you want them to be licenseware etc... I'm
willing to distribute them.

Also if you know anyone that had licenseware distributed by L.A.P.D.
then please get in touch as I have taken over the software and I'll need
your details etc...

Together we can make it happen!

The all-time classic is ConNect. It used to be shareware, but the
authors have now released the utility that creates the user-key.

Boy!!! That would be a great addition to the Atari family of Emulators. You know you may want to try posting this at the "Atari St Emulator" site called "Little Green Desktop". Use Yahoo or some search engine to find it. Or try this address: http://fatal-design.com/desktop/

This site would love to hear from you including many other Atari sites. Please post it there!!

You got me hooked. :-)

I have the following items for sale. Prices do not include shipping from Florida (buyer pays shipping). US postal money orders only please. Email any reasonable offers to larryr@cyou.com.

Software

Stalker 3 (Box & Docs) $ 7

Thunder, Batteries Included (Docs) $ 3
Mark Williams C (Docs) $10
GFA Draft (Docs) $ 5
EZ Track Plus (Docs) $ 7

Books - All $10 each

Programmer's Guide to GEM - Sybex
CManship Complete - Clayton Walnum (with Disk)

Abacus Books - All $10 each

#2 Atari ST Internals
#3 Atari ST GEM Programmer's Reference
#5 Atari ST Tricks & Tips (with Disk)
#6 Atari ST Graphics and Sound
#7 Atari ST Logo User's Guide

FDT is great for Mega STe's -down-...I actually like it a lot. Its only problem is that it has problems with more advanced Atari machines such as my Falcon... ;-(

CoNnect is awesome, especially if you are running in higher resolutions. It even supports sound for events, and is now totally free... ;-)

Later...

Ooop, just saw that you own a Mega ST4...hmm, I guess I would go with FDT too, unless you have a graphics card or the RSVE upgrade... ;-)

The status word on the stack can be checked to determine if an interrupt
handler was interrupted. In that case, with some stack manipulation, the
scheduler can let the interrupted code complete it⍰s task, and have the RTE
jump to the scheduler. It⍰s a bit tricky, but feasible.

Cheers Peter

I am trying to get hold of a copy of "Bullet Train" for STOS as it did not come with my copy (those supplied with ST's on a double sided disk had a few files missing, including "BT").

I would appreciate it if someone could tell me where I can get a copy from, or e-mail me a copy as an attachment.

Thanks.

Andi.

PR>The status word on the stack can be checked to determine if an

PR>interrupt handler was interrupted. In that case, with some stack
PR>manipulation, the scheduler can let the interrupted code complete it's
PR>task, and have the RTE jump to the scheduler. It's a bit tricky, but
PR>feasible.
There's one small problem with that:
It's not forbidden to use the stack while in an interrupt. And if the
interrupt routine can place some data on the stack you have only one chance
to to find the SR: it's at a fixed position. But you cannot asure that unless
you forbidd task switches while in supervisor mode...
Or did I miss something?

Bye

Joerg

Hallo everybody.

When the Pure C shell runs Pasm, its messages are communicated to the
shell and displayed in the message window.

Does anybody happen to know how this is done?
There must be some interface.

I write my own shell and compiler for my own programming language,
but I use Pasm & Plink to produce binaries. I want to do the same
as Pure C: recieve the Bios output from Pasm & Plink and put them
in my own journal.

Henk.

ftp://piwo.bl.pg.gda.pl/pub/atari/mint/Programming/Gcc/

The newest GCC there is 2.8.1, also comes with dome docs in HYP format
(in German).

Here's an interesting tidbit I ran across this evening...

http://www.devili.iki.fi/cpm/gemworld.html

Caldera has released the source code to GEM (but only Intel at this point, it seems) under the GPL (meaning--it's free!). Atari ST programmers still may want to check this out, seeing as they have an Atari developer's kit on there as well as the source code to many of the GEM productivity applications such as GEM Graph, GEM Write and GEM Desktop Publisher.

Are you sure that there are sources for the applications? The ones I tried contained binaries only. Anyway, the gem sources are welcome. I will try to compile the desktop as well as the resource construction set under Osis.

Easy question,

My screen's narrower than the screenmode i'm using. How do I centre it?

e.g. I'm opening a 256 pixel wide screen on a 320 wide screenmode.

I'm guessing I can get the width from the displayinfo database, but I can't
find the values I need.

Hi!

Are you planning to emulate the DSP as well? (If you don't it will be a
pretty useless emulator as allmost all Falcon programs use it :-)

I stand corrected--it is only the source to GEM/3 itself that is available
right now. Hopefully they will GPL at least some of the apps down the road.

Yup, it's good, but because it completely ignores GEM it does not work on
my Falcon or TT, and not even the Mega ST with Lacescan enabled.

I use Freeze Dried Terminal on my TT. It seems to work well in the TT medium
resolution screen. I also use it using the Nova VME Plus graphics card in
256 colors although some of it's features don't work.

Freeze Dried Terminal works well in TT low (16 colors). I haven't tried it
all that much in the TT medium but imagine the same problems as with the 256
color mode using the Nova card.

Sorry about the mistake in my previous post; I hardly ever use the standard
TT screen resolutions.

TT low has 256 colors (8 bits). It's TT medium (and ST low) that has 16 colors.

I should have been more precise, what I mean is that it won't work on my
TT or Falcon in anything but ST-videomodes.

If anyones interested in restoreing .ST files back to disc and can't figure
it out (I know I could not find a prog to do it) then I'll shell-up my
beta image restore program for release.

Chris

I did manage to do it once using MakeDisk.Exe running under Soft_PC on a TT, but it was not very pleasant to do it that way.

Another tool, which is for TOS use, that claims to do it is the JAY_MSA packer/unpacker, which is intended to support '.ST' files as an alternative for the '.MSA' format. Unfortunately no version I've tried could handle the '.ST' files I tested, so possibly the format has variations unknown to 'Jay'.

But there is another tool that does the job properly under TOS, and that is ST2DISK, which is a program dedicated to this particular need. It can not be used to create '.ST' files, but only to unpack them to disks. You should be able to find it on one of the major PACIFIST-related pages. The program needs to be registered for unlimited use, but it is costfree to register, and even unregistered it can create complete disks. It just takes a bit longer then (some 'nag' dialogs).

Even so, don't hesitate to go on with your project if it interests you. Perhaps yours will eventually have '.ST' creation ability too...?

Hi thanks for the info, I did see ST2DISC but it moaned about something so I gave up with it,

My program to restore .ST files to disc is 100% working :-) I'll be adding the make .ST files to it tonight so you can convert either way. Once finised I'll post the beta to anyone who will be willing to test it ?

thanks

Chris

Can't help with an ST version I'm afraid but the Acorn BBC Micro
computers had Basic source for this program. "BBC Basic" is an
absolute doddle to understand and very well structured btw - porting
it to Pascal wouldn't take much longer than typing it in! ;-)

This must be ten years old if it's a day!!! If you don't know too much C or the names referred to by the macros I can have the compiler produce commented asm ...

```
#define  DEF_VARS
#include <sysvars.h>
#include <cpu.h>
#include "misc.h"

bool
_mi_vbl_slot(newvbl,install)
void (*newvbl)();
bool install;
/*[  bool _mi_vbl_slot(newvbl,install)
     void (*newvbl)();
     bool install;

 Installs or removes a handler from the VBL queue. 'install' should be
true
 to install the user handler 'newvbl' which will be installed in the
first
 free slot located. true will be returned for success and false for
failure.

 When 'install' is false then 'newvbl' is searched for in the VBL
queue and
 removed if it located, returning true for success and false for
failure.

 The routine saves the VBL semaphore and then disables VBL processing
while it
 searches and restores the original state before returning. The
current
 processor state is saved and supervisor state obtained if neccessary,
the
```

```
 previous state being re-instated before returning.

 False denotes a full VBL queue for installation and that the handler
has
 already been removed for removal.
]*/
{UWORD   old_vblsem;
 bool    old_state=cp_procstate();
 int i;
 ptr *addr         =(install ? NULL : newvbl);

 if (!old_state)   cp_superstate();
 old_vblsem = *SYS_VBLSEM;
 for (
     i = 0;
     i < *SYS_NVBLS;
     i += 1
     )    {

     if ((*SYS_VBLQUEUE)[i] == (ulong)addr)    {
          if (install)  (*SYS_VBLQUEUE)[i] = (ulong)newvbl;
          else     (*SYS_VBLQUEUE)[i] = (ulong)NULL;

          *SYS_VBLSEM = old_vblsem;
          if (!old_state)    cp_userstate();
          return true;
     }
 }

 *SYS_VBLSEM = old_vblsem;
 if (!old_state)   cp_userstate();
 return false;
}

I guess ((320 - 256) / 2) isn't the answer you're after?

>I'm guessing I can get the width from the displayinfo database, but I can't
>find the values I need.

Depends what interface you are using. For the AES you'd enquire
WH_DESKTOP via wind_get(). The VDI has it in the "work out" array.
Offhand I haven't a clue where TOS gets it from (probably the LineA).

Yes, it looks just like all those near unusable demo versions that some
people like to release. I don't see why they do that, as such versions
are likely to make users _less_ inclined to register, since they get an
unpleasant memory associated with that software.

But in the case of ST2DISK, the program really can do all the things that
the registered version can. It is just a bit awkward to do it unregistered.

>My program to restore .ST files to disc is 100% working :-) I'll be adding

I'm willing, but can't test the .ST files with emulators, since I do not
use PCs.

Actually, I figured out a way a long time ago to get FzT to work great in Falcon 16 color mode.
As long as you are running NVDI (even Warp 9). For some reason without screen acceleration, the colors just won't work right at all. Anyway:

*First, you have to reverse black and white in the pallette because FzT mixes these up internally. Just use whatever CPX you use to adjust this. I simply created a NEWDESK.INF file called FZT.INF (which had these colors) and with X-Boot used this .INF file whenever I booted up to use FzT.

*Then, I use the serial patch program called FAST_SER.PRG. It allows remapping the port so that when you select 19,200 in FzT, you actually get 57,600. So your 28.8 or 56k modem will work as it should.

*And make sure you use a third party file selector, as the normal Falcon's (TOS 4) selector will create some redraw problems.

*Make sure your Falcon is in 16 color mode (not 256 or TC as this will create a few errors and problems).

*Now as far as working under MagiC? It does that too. Just make sure you're in 16 color mode, and set it up for single tasking.

Sounds interresting. What did you use to produce the patched ROM image?
Could it also be used to integrate AES 3.40 (from TOS 4) into TOS 3.06?
Then, how did you make your new EPROM?

That's correct, PureC hasn't been updated or sold since 1992 (IIRC). It's a shame, but I believe ASH had some legal problems with Borland and just had to drop it. I don't think anybody has it in stock now, so you'll have to look for second-hand copies.

No this isn't a message about porn pics... ;)

I'm working on a project where I have a number of G_STRINGs in a rsc file. The problem is as follows.

If I change the G_STRING to be equal to a static message in my project, it will always redraw correctly.

However if I change the G_STRING to be equal to a message from an external source, upon redraw it is corrupted, changed whatever you want to call it. It's not what it was set to anymore.

Any ideas on where I'm going wrong? Or has the flu medicine sapped the last of my mental abilities...

Well, all I can say is that this should work! If you set, for a G_STRING object, the op_spec pointer to point to a string, it should display that string. I suggest you make sure you set the ob_spec correctly. If you are sure you do, check that the string pointed to by the ob_spec is indeed intact. I've done this plenty times, and it works, so I'm quite sure its not a AES problem...

In this case it was a modem. I finally found my problem. It was

a dual problem actually.

First I was directly manipulating the pointers of the ob_spec, so of course temporary strings were lost.

Secondly after I modified that to be a strcpy, I discovered that part of my strings weren't terminated. All seems to be fine now.

Thanks everyone,

Dan Ackerman

Hi all,

Does any of you know where I can find falcon/clab mk1
schematics on the web?
I'm also wondering about it's power supply requirements.
I know this is probably a bit off topic, excuses for that.

Thanx in advance!

Guido.

Hi,

For a long time now, many programmers have been complaining that there are no programming docs for MagiC in English, and the MagiC author (Andreas Kromke) doesn't have the time to do his own translation.

Some of you may recall back in January a brief discussion about the lack of English programming docs for MagiC. Guy Harrison suggested starting a "community project" in the form of a web site where people could download parts of the German documentation and submit translations.

As a result, I've been in touch with Dr Kromke, who has kindly given permission to go ahead with the project, and has supplied the latest docs for MagiC. I've set up a pilot project with a few files initially, as the docs are extensive (the archive unpacks to over a megabyte). It's at:

http://www.whalley.demon.co.uk/atari/mdp/

The idea behind this site is to make available the German docs in easily-digestible (and downloadable) chunks for people to translate as and

when they have the time and inclination. I myself have no German worth speaking of and I'm not a programmer either, so my role in this is purely as host for the pages and co-ordinator (where necessary) for the results.

The site also includes info on translation tools to help get you started.

All help will be gratefully received! Please take a look and contribute if you are able.

Thanks,
John

I occasionally use Lattice (5.06) on Pacifist -it's quicker than switching on the ST and transferring stuff by floppy (Don't ask), and I have a very annoying problem.
Lattice will overwrite an object file, but absolutely refuses to overwrite the actual program file, so I have to delete the previous version by hand.
Any ideas about what I'm doing wrong - apart from using a PC?
Regards
Brian O'Donnell

It's not actually called mdp, that's just the name of the directory it's in
on my web site. It's called the MagiC Documentation Project. However, if
it's going to cause confusion, I could change the directory name. Is it
likely to be a big problem, as anyone seeing the full name should have no

doubt as to what this is?

Hello,

I have a complete Atari Falcon 030 system for sale for 350gbp ono.

This does not include shipping - I would prefer a buyer to
collect so that they can assure themselves that everything
is working before taking it away - I live in Newcastle upon Tyne.

See below for a complete description. Any questions, feel free to
email me.

Michael
--
To send me an email substitute @ for % in this address:
michael.clemmetsen%syntegra.bt.co.uk

---------- cut here ----------
** Falcon System **
4MB RAM, no internal IDE
External 520MB SCSI drive and Falcon SCSI to 50w SCSI connector.
Loaded and configured with the software listed below as well as
loads of freeware, shareware and demos mainly downloaded from the
internet.
        (Seagate mechanism - ST3655N, including technical
        documentation.
        The drive is internally terminated so you do not need a
        terminator, but will have to put it at the end of the SCSI
        chain if you use any other devices.)
ClockPatch fitted (by System Solutions)
        (Required for accurate Direct to Disk recording)
TT Keys fitted
        (High quality replacement keyboard contact cups that
         improve the keyboard feel -you'll definitely notice
         the difference if you are a touch typist)
Falcon VDU port to VGA adapter cable
        (required to connect to a SVGA or VGA monitor)
BlowUp Hard II

(Hardware attachment that plugs into the cartridge port providing a faster horizontal sync, thereby allowing higher resolutions on suitable monitors, i.e. those that can take a variable horizontal synch signal up to 50KHz. Includes software drivers and manual. The software can be used without the hardware if the monitor is unsuitable, i.e. lower refresh rates have to be used.)

2 Mice

(Not Atari, i.e. better microswitched devices)

Tabby graphics tablet

(Approximately A5 size, including software drivers and manual)

SVGA Monitor

(Includes Polarising screen filter. Works well with the BlowUp software, providing resolutions around 800x520, depending on colour depth.)

Epson LQ100 24pin dot-matrix printer including Manual

** Commercial Software **

All are english language versions and are complete with original disks and manuals.

* System

HD Driver 6

(Hard disk driver including format and setup)

NVDI 4.02

(Display accelerator and TrueType and Speedo Font display and printing.
Including over 40 high quality Truetype fonts.)

Magic 5.13

(Pre-emptive multi-tasking operating system, including support for Windows compatible long file names)

Kobold 2.5

(Fast file copier and file management tool)

Geneva 006

(Co-operative multi-tasking operating system)

NeoDesk 4 005

(Replacement Desktop integrates seamlessly with Geneva but also works with Magic)

NeoDesk CLI 2

(Command line interface that integrates with NeoDesk)

* Productivity

Papyrus 5.15

(The best word processor/pagelayout application on the Atari platform. Includes features, such as discontinuous selection not available in MS Word. Can import and export to MS Word)

Calamus S

(Premier DTP app.)

Twist 2

(Relational Database)
Apex Media
(Falcon only graphics and animation app.)

* Programming
Lattice C 5.52
(Professional C compiler that can target all 680x0 processors. Comes with libraries and documentation for creating fully compliant GEM programs.)
HiSoft C
(C interpreter. May not work on the Falcon, but useful for its GEM library which could be used with Lattice)

* Games
The Killing Cloud
(3D point of view strategy/flight sim/shootemup in 21st Century Los Angeles.
May work on the Falcon using one of the ST compatability programs e.g. Backwards)
Epic
(3D point of view strategy/flight sim/shootemup in space and on distant planets.
May work on the Falcon using one of the ST compatability programs e.g. Backwards)
Frontier - Elite II
(This works fine on the Falcon and can run from the hard disk)

** Books & Manuals & Magazines **
Falcon System Manual
CalApp User Guide
(Calendar and Appointment Software supplied with Falcon)

The Atari Compendium by Scott Sanders (2 volumes)
Modern Atari System Software (HiSoft)
(Both these books are essential for any serious Atari software development as they document all the system calls and style guidelines for all released versions of the TOS operating system.
As far as I know none of them are published anymore

Atari World - issues 1 to 11 inclusive

** Other **
Box of floppy disks with a variety of public domain, freeware and shareware software, e.g. MiNT and a bunch of MiNT related tools and utilities.

A few cables that may be of use.

groan

Seriously, though, in the absence of a flood of confused people I'll probably leave it as it is, having just publicised the thing. Anyone linking to the site or mentioning it in newsgroups etc is going to use the word MagiC somewhere (which is a bit of a giveaway, no?), so I don't really see how altering a directory name is going to make much difference. Unless it looks like someone's going to try to start another pointless OS war (for the record, I mostly use MagiC, but I also have a MiNT setup and regard the two OSes as having different strengths and weaknesses: you use whichever is appropriate to your needs).

No I cant.

> I have a fine piece of software, which plays midifiles on my

TT-Digger is a disassembler. It recognizes code and translates it
to machine code instructions. It is intended for analysing or reading
code of which you do not have the sources.
!!It is forbidden to use it for reverse engeneering.!!
It is a powerfull tool for pinpointing bugs however.

Henk.

The Toolbox is nearly ready to go to beta test.

The Toolbox is a DLL engine (written entirely in 68k assembly language)
for the Atari ST family of computers, and requires just 32k of RAM for
itself, and a computer running TOS 1.0 or better.

The archive (about 60 kbytes, uncompressed it totals around 150k) contains
the Toolbox itself, example source code for a Toolbox library and an
example application to use that library (designed around Lattice C 5.60,
but should be usable with other languages), a CPX to configure libraries,
and an accessory to display libraries that are currently loaded, and a few
bare-bones manuals.

What is currently needed is a selection of people with varied computers to
torture-test the Toolbox and supplied utils, and to write libraries and
applications that use the Toolbox.

Hello everyone.

Can someone please give me the resolutions of TT-low, TT-med and
TT-high (bitplanes & max X and max Y).

(Off topic:it took me three hours to post this usenet message using
windows 3.11 and Free agent. the computer locks everytime I press
numlock, scroll-lock is blinking, it crashes the serial port everytime
I try to connect, it takes 4-5 tries to connect to the server - coz
windows cannot handle the serial interface. grrr. fuck microsoft,
at first I thought it was a virus - but no it's just windows)

What exactly is the limit with v_gtext()? Hitherto I checked with vqt_extent() whether the extent if the string wasn't longer that twice the window width, and this works perfectly with mono-spaced fonts, even with large screens, but strangely enough it doesn't work with proportional fonts and very wide windows. Specifically, it doesn't work on a 17" monitor with the window set to full screen size. It seems there is an absolute extent beyond which v_gtext() warps the lines on screen, but how big is it?

I have the following for items for sale. The only rule is that the Jag, Jag CD, and power pads must go together.
Here then, for your viewing pleasure is my list of Jag stuff. :)

Atari Jaguar with CD and 2 Power Pads, manuals, and boxes.

Cartridge Games:
Alien vs. Predator Cybermorph Fight for Life
Iron Soldier Kasumi Ninja Raiden
Rayman Theme Park Zool2
Trevor McFur in the Crescent Galaxy
Val d'Isere Skiing & Snowboarding

CD Games:
Blue Lightning Myst Vid Grid
BTW, I am not leaving the Atari scene.
Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI, ExtedDos Pro, ICD HD utilities.

I suppose you use a C compiler.
It shouldnt be limited at all.
The interface allows you to pass the number of entries in the
intin array. Unfortunately a bunch of compilers use global

static arrays for all those AES & VDI arrays. That is what is limiting you.

There is nothing against rewriting the library module for v_gtext in which you use the existing global array in a own local defined aespb with all the other arrays locally declared with the length you want them to have.

Henk.

Care to post a snippet of code that causes this problem?

>Specifically, it doesn't

Methinks there'll be lots of factors. The standard font table has (iirc) only 8 bit character offsets. These may get translated into bugs or simply mean a limit of round about 256 chars on a line. I

wouldn't expect NVDI to suffer from this kind of problem though, or a
proportional non standard font, like a TrueType.

Memory might be an issue. If the reserved cache size has been exceeded
then this might trigger a bug in NVDI.

I'm starting to waffle. Lets see the code! :-)

I guess it is a file for use with GFABASIC Window of GFABASIC DOS.
I seen GFABASIC DOS 4.11 or something, it was just a bad imitation of
the AES-routines on Atari. But 7.0 i guess windows.

I'm not sure I understand this correctly. I use PureC and the
prototype for v_gtext is

```
  void v_gtext(int handle,int x,int y,char *string);
```

I suppose I could rewrite the library function, but then I don't have the source code and don't know what AES/VDI calls it uses, or whether it employs global arrays. In the latter case: I wonder why it shouldn't constrict itself with a simple sizeof() operation.

on Fri 02-04-1999 21:44 Guy Harrison wrote:

>Care to post a snippet of code that causes this problem?

Well, take this for example:

```
void draw_line(int whdl)
{
  char s[2000+1];
  int pxy[4];
  extern int vdi_handle;

  memset(s,'b',sizeof(s)); /* or choose any character */
  s[2000]='\0';

  wind_get(whdl,WF_WORKXYWH,&pxy[0],&pxy[1],&pxy[2],&pxy[3])
  pxy[2] += pxy[0]-1;
  pxy[3] += pxy[1]-1;

  vs_clip(vdi_handle,1,pxy);

  v_gtext(vdi_handle,pxy[0],pxy[1],s);
```

```
  ... function for setting horizontal slider size and position

  vs_clip(vdi_handle,0,pxy);
}
```

Now, if you do this, you will probably notice right away, and certainly after scrolling horizontally, that the line gets warped. The bug is independent of whether GDOS or NVDI or whatever is resident.

The solution which I have hitherto employed was to check if the extent of the string exceeds twice the window width and then truncate the string, if necessary:

```
  int extent[8];
  vqt_extent(vdi_handle,s,extent);
  if (extent[4]>(pxy[2]-pxy[0]+1))
    s[get_linepos(s,pxy[0],pxy[2])]='\0';
```

(The function get_linepos() calculates the position in the character array where the extent would exceed window width.)

This works perfectly with mono-spaced fonts, even with large screens, but it doesn't always work with proportional fonts. It works with "normal" window sizes and proportional fonts, but not, as I said before, with proportional fonts and a window set to full 17" screen size.

Nope.

320/480 --> 40/30
640/480 --> 80/30
1280/960 --> 160/60

The system font is 8x16 pixels.

Most (all?) VDI-bindings I've seen limits the lenght to 80 characters. For
some stupid reason these bindings copy the entire string to a global array
instead of just using the refered string, you can write your own binding
to work around this. Just remember that the VDI expects each character to
be 16 bit (word), and not 8 bit.

Lack of imagination and lazyness?

I had a look at the PureC VDI lib. (with TT-Digger!!)
It seems there is no check on the length of the string.
And indeed the parameter areas are fixed length and static.
If the string is more than 256 characters the x and y are overwritten
and if the string is more than about 520, stuff not belonging to
the VDI is overwritten.

A few years ago I rewrote the whole GEMlib because I needed
a reentrant one.

You could split up the string in chunks of 255 char's,
or shall i dig it up and mail you my v_gtext ?
It is a long time ago however, so it will take som time.
But never mind, it's always good to fresh things up.

Henk.

Thats why they all must copy.

Henk.

I nearly said "Noooo!" until I thought better of it and checked my
docs. ;-)

Looks like you've hit the nail on the head. I assumed (long forgot
actually), probably as Jos did, that a pointer to the string was
passed, not the darn thing itself.

>There is nothing against rewriting the library module for v_gtext
>in which you use the existing global array in a own local defined

>them to have.

Hmm, I wonder if using wide strings would help any? Dunno anything
about them, but if every other char is zero then this could be local
intin[] directly. It's a thought. Can't be bothered to investigate it
though!

Possibly DRI had this in mind originally.
Or it could as well be, as they called themselves "digital",
and looking at their fingers, that they noticed the space between
those. ;-)

Henk.

Hi Jos!

JDB>char s[2000+1];
JDB>v_gtext(vdi_handle,pxy[0],pxy[1],s);
The problem might be that the VDI itself limits the length of the intin array and thereby the length of the string, so you will have to spilt your string. You can inquire the maximum length supported by the VDI via vq_extnd(1). You will then find the length in workout[15], -1 means no limit

Bye

Joerg

I have the following for sale. I prefer to sell the whole lot as a package. However, I am willing to sell individual items but the ST must sell as a unit and not as parts.
Here then for your viewing pleasure is a list of my ST stuff :) :
HARDWARE: $200.00 + $15.00 S&H
4mb 520ST with SC1224 color Monitor, SF314 Floppy Drive, mouse, joystick, l, manual, System & language disks, and mouse cleaning ball.

GAMES: $5.00 each + $5.00 S&H
GBA Championship Basketball The Sentry
MetroCross Star Glider
Star Ray Shadow of theBeast II
Guild of Thieves Golden Path
AD&D Hillsfar Gold Runner II
Station Fall Grid Iron
The Black Cauldron Flight Simulator II
Battleship
Pirates of the Barbary Coast

APPLICATIONS: $7.00 each + $5.00 S&H
Habba Check Minder H&D Base Hippo Pixel
Hippo Fonts Cyber Sculpt Art & Film Director
Multi Desk Calamus Outline Art OutBurst 3.3
VIP Professional Flash That's Write
v.3.1G
Atari Logo

BOOKS/PUBLICATIONS:
ST Basic Source Book
A Source Book for Atari Logo

ENTIRE PACKAGE: $250.00 +$20.00 S&H
BTW, I am not leaving the Atari scene.

> ie Port addresses, IRQ, etc

The printer port is easy, here is some source, warts and all. It was originally bad code posted in here that I fixed up to make work - ignore the commented code, though it might be an interesting documentary on how not to do things.

You could also do it with Bconout from TOS.

```
; Simple code to print a text file
;
    clr.l    -(sp)            ;    supervisor
    move.w    #32,-(sp)

Yes, but why to a static, global array? It's very limiting and makes it
impossible to write thread-safe code.

Hi!
I'm just experimenting in ASM (68000 STE) (it's fast, very fast) and
just created some wonderful rasters using the XBIOS 7-call.
I tried the $ff8240-vector, but that wasn't really what I was looking
for.
Anyway I now got the idea to install theese to VBL! I can call
like any program in VBL, but not my rastersource.

Can someone tell me how to make a proper VBL call?

/Jeppe

Hm. I've had problems reported with lines of about 140 chars. I'll try
again and make sure this report is correct.

>You could split up the string in chunks of 255 char's,

That would probably be best. I don't think I'll ever get windows with
that many chars.

>or shall i dig it up and mail you my v_gtext ?

Better still.

Thanks.

I noticed you don't use parameter `y'. Are you handling 4 bytes in
ptsin in the assembler code? (I'm afraid I don't know any assembler.)

The portion of the stack that contains x and y is physically
acting as the ptsin array. So the address of that goes directly
to vdipb.
This is written for Pure C on ATARI with a 68K CPU.
It relies on the stack order and stack direction.
Very unportable. :-)
The 0L's (or nil) are for arrays that are not needed, and I dont
want to declare dummy everytime. (Over a 100 vdi functions)

Henk.

P.S.

I said I tested it, but I must confess I did NOT test it with
a string over 2000 bytes. ;-)

This should fit on a 1280 screen, unless the font you use is on avarage
wider than 8 pixels per char. Which VDI do you use?

I have a NOVA vdi version, that has problems with clipping Italic's

Henk.

Shame on me!!! Not wise enough.
The &x can only work for a cdecl lib.
And that was exactly where my lib was meant for.

Jos!! change v_gtext as follows:
Put x & y in a local array and pass that:

```
int pin[2];

pin[0]=x,pin[1]=y;

&x ----> &pin
```

Or forget about it, because this whole thing may not be the the cause
of your problem at all.

The reason why it worked for me, is one of the great riddles
one encounters now and then. I am investigating this anyhow.

Henk.

Hasty again, I suppose. Should be &x ----> pin.

Are you referring to the real avarage character width? Or does VDI
query vqt_attributes() to get the "avarage" charwidth? With "Chicago",
a proportional GDOS font on my old Atari, I get a width of 12 in both
attributes[8] and attributes[6].

>Which VDI do you use?

I don't know. :)

>I have a NOVA vdi version, that has problems with clipping Italic's

Same here.

Hello,

I have a complete Atari Falcon 030 system for sale for 275gbp.
Buyer collects or pays delivery.

4MB RAM, 520MB HardDisk, Epson LQ 100 Printer, SVGA monitor, Graphics
Tablet, loads of commercial and public domain software, books and
magazines. Email me for a complete description.

Michael

PHENIX 060 - Version R1

We enjoy to announce you an updating of our site, particularly important in the domain of the PHENIX, our computer.

Here are the last changes :

1 - the 040 version of the PHENIX is abandoned !
The PHOENIX will be therefore a computer basicly provided with the mythical 68060 at 80MHz, giving 120 MIPS
(040 provides 32 MIPS at 40 MHz!).
Don't be affraid, prices of this 060 have quite changed and we are therefore in measure to propose a 3 or 4 times more powerful machine for only 2000 FF more in the full configuration.
This tariff could decrease according to providing of 060 because this tariff takes account of the worst offer of our suppliers.

2 - LINUX 060 already exists!
Whereas with one or two 040, LINUX would have been just usable, the 060 offers the necessary strength for a comfortable utilization...
Let's not speak of two 060 (240 MIPS).

3 - the DSP56301 works at 100 MHz and its SRAM descends to 12ns. A light increase of cost for 20 MIPS more(by DSP!).
The addition of a daughter card fitted with 3 DSP at 100 MHz is more that ever of actuality with recent and new objectives of some of our customers and partners.
This daughter card will be connected in the PCI slot #3 but it will be possible to add an identical second of it in the PCI slot #2 (the #1 is occupied by the graphic card).
Total, 7 DSP at 100 MIPS each (700 MIPS) and 3 DSP connectors offering each 4 high bi-directional debit serial channels (either 12) of 33Mbits/s for all numeric application ways...

4 - The utilization of SDRAM instead of EDO is essentially reported to an ulterior version of the PHENIX 060 for cost reasons and time of development. The SDRAM supports are 4 times cheaper than the EDO supports (so 60 FFS more) and besides it's necessary to harmonize SDRAM signals in 3.3 V and signals of the 060 bus in 5V with very speed buffers (2ns) and costly (60 FF of supplement).
Total, the added 120 FF on the motherboard compensate the gap of tariff between a 32 Mo SIMM and a 32 Mo SDRAM.
For those that know the 060, it is true that he is compatible with signals in 3.3V, but our PCI bridge is not: what obliges us to choose 5 V for all components of the 060 local bus.

Until 40 MHz as regards to performances, the SDRAM doesn't offer ANY advantage on the EDO 60ns: accesses are made on all sides in 1 cycle. Between 40 and 80 MHz, the SDRAM makes difference because she always permits BURST accesses in 1 cycle whereas the EDO obliges accesses in 2 cycles (that why the SDRAM imposed itself on computers where processsors reach 66, 80 MHz, and more...

On the PHENIX 060, the only way to take profit from the SDRAM is to pass the 060 in ' FULL SPEED' mode on its bus.
It means that instead of accessing the bus to an half frequency of its execution units (in our case 40 and 80 MHz), the 060 would access the bus to the same frequency than its units, so 80 MHz.
The gain is immediate: with EDO 60 nses, we can access at 80 MHz in BURST in 2 cycles, whereas the SDRAM offers 1 cycle.
It means that the 060 bandwith in RAM is 2 times more important !
Unfortunately, our PCI bridge can't be matched with the 060 beyond 45 MHz (verified timing for CENTEK by manufactory), what obliges us 060 accesses at half speed (HALF-SPEED mode) in bridge (toward the PCI bus).
We have a solution to this problem, but it will be for a little bit later, even though the challenge to wire a 060 in full speed on the SDRAM is exciting enough because that has never been achieved!
Imagine that the 060 in FULL-SPEED mode at 80 MHz is able" to swallow " 320 Mo/s with BURST of 1 cycle 80 MHz!
On Phenix R1, we should be sufficient with BURST 1 cycle 40 MHz, so 160 Mo/s... It is already excellent.

The PHENIX should be produced from JUNE 99.

For all question, we recommand you to visit our site before addressing you to our services, because we are already overflowed by numerous questions...

Thank you for your attention.

Pure C by default uses D0,1,2 and A0,1 for passing parameters.
cdecl forces the more common method of pushing parameters on the stack.
Moreover, because it has been so long ago I forgot that I wrote
this reentrant lib for use by MEGAMAX, not Pure C hence the omission
of the word cdecl.
Pure C correctly moved x from D1 to a temp on the stack, but
didnt do that for y. I had the corresponding warning 'parameter
not used' switched off. (for a otherwise good reason)

> >pin[0]=x,pin[1]=y;
> >&x ----> &pin
>

Allways when I've been hasty I know I'm gonna regret.
But you're skilled enough to correct me. :-)

> >of your problem at all.
>
> What makes you think so? (I haven't tested it yet.)

You mentioning using 140 byte string.
Pure C can have 256.

Changing setvdipb to cdecl is new. I can do the same for the vdipb
structure as I did for x and y, which saved a couple of long moves.
Compare the assembler parts.

Henk.

Yes. Because the longer the string the more exact the avarage will be.
The more you can be sure whether clipping will take place.

Hi All!

This is a message to announce the opening of my own website! It's rather basic at the moment, but that's only because I'm a novice at HTML! ;-))

I used a program called Web Wizard, published by Cadenza Software for the Atari series of computers. It's a great program that enables the putting together of web pages with background images and sound files, and I think they look pretty good! ;-))

At present I have four main sections: My Homepages, My Atari Page, Atari Downloads, and a Links section; but I plan to expand these further with new sections.

The Downloads page only has two files to download, and they are Demos for the Atari Falcon, but I'm open to suggestions on what else to put on there. I only want to put Atari stuff there, and not commercial stuff neither!! :) The demos are: Sonoluminesenz by Avena, and The Lost Blubb by Lazer. These can be hard to track down on the Web, so that's why I've put them on!!

The Links section I think is pretty good, as well as Atari websites there are more general stuff there too, including a section of Online Newspapers that are around (only UK ones at the mo'!).

Whats the address, I hear you cry? Well its:

http://www.users.zetnet.co.uk/jfhaslam/index.htm

Any comments/suggestions on the site are welcome, just email to the address below!

Cheers!

James

Hi !

I'm searching people who do work / have wored with GEM++ 2.x Libary.
Perhabs someone has done a GEM++ 2.1 ??

What I need to know is - how to compile this libary ..... anyone done
this ??

bye

Alex

- Linker and assembler sources
- A working compiler environment
- Atari libs or library sources

You'll also need to be able to generate some library file needed by
GCC to build a cross-GCC. You should be able to generate this file using
GCC on Atari (or on any other m68k machine).

There actually is a working TOS cross-compiler for Linux on some FTP
site somewhere. Try an FTP search...

: Could egcs be used instead of gcc?

Probably, as long as the source-tree contains the cross-compiling stuff...

: what about C/C++ libraries and GEM libraries?

You can either get the binaries from the Atari GCC version or get the
sources and use the cross-compiler to recompile them...

/|\ Scheduled Chat Sessions

Visit our club website and Click the Main Chat Room menu option to join
us for the scheduled chats. Chats are schedule every Saturday night at
8:00PM CST. Please stop by for a while.

We are asking Kent Kordes, Systems for Tomorrow to join us. From my
experience, Kent has been a wonderful distributor of Atari hardware and
software here in North America. Not only does he carry products for the
ST computer line, but the Jaguar and Lynx systems as well! Got a
question about products and the future products being released? Stop in
and asked.

```
  |||    ATARI USERS OF NORTH TEXAS
  )|(    http://www.atariusers.com/AUNT
 / | \   Read the News, Join the Chats, Share the Meyhem!
```

Also....

We have a project going on right now to build up the Atari fandom in the United States, Canada, and other parts of our dear land mass. The belief is that there are many Atarians out there going on without a user group when hundreds (maybe thousands) of people still use Atari computers.

So if you are in America and Canada especially, just send your name, E-mail address, and State to:

Greg@atariusers.com

We'll be setting up a webpage soon. Who knows? A user group may be just waiting to be started in YOUR AREA!

Hello Atari World,

Can someone email me the BASIC listing for the old Atari game Kingdom. I am teaching a class on programming and I would like to show the students how a simulation is done and as I remember, this was a pretty good one.

Thanks

programmer,comp.arch.embedded

Hi Folks,

i've got a question that is not answered in the motorola databooks. On
the Coldfire processor the first instruction of an interrupt handler is
executed before further interrupts are possible (source: Coldfire Family
Users Manual). I can't find such a passage in the M68000 or M68020
manual.
So, my question is, what happens on a M68000/68010/68020 in the
following
situation:

1. privileg level is zero
2. interrupt request for level 1 occurs
3. cpu saves sr and pc on the stack
4. cpu fetches interrupt vector
5. interrupt request for level 2 occurs!
(a)
6. first instruction of level 1 irq handler is executed
7. cpu saves sr and pc on the stack
8. cpu fetches interrupt vector
...

(b)
6. nothing
7. same as step 7 above...

As i read the ColdFire Manual, branch (a) is correct for this
architecture,
but i expect the M68000 to use branch (b). This is very important, since
my
task scheduler switches tasks in the interrupt. Therefore he needs to
change the status register and the program counter on the stack. This
can't
be done if the interrupt is a nested one.

Any ideas?

Please send answers to this group and to my mail address:
haustein@informatik.rwth-aachen.de

Thank you, ciao,

Tobias

My problems could be solved in two ways: by simply truncating the
string to 255 chars (it turned out that the offending string in the
test phase wasn't 138 chars long, as I said before, but 318), which is
the unsatisfactory easy way out, and by applying your patches, which
is the nicer way, because it allows me to use the maximum line length
of 1000 chars in email messages.

Thanks again!

6.061, ask any archie for an appropriate ftp site.

Oh, and BTW it is a waste of time to get AHDI. I'd advise you to
cantact Uwe Seimet and get a recent version of his HDDRIVER. That
software will be compatible with new hd and exchangeable media drives
(PD, MO, JAZ, ZIP, etc., AFAIK even DVD-RAM).

Thorsten

Greetings all,

Well, as most of the times, the subject line says it all. How do I use EVNT_MULTI to look for either (and if possible both) mouse buttons being pushed?

Thanks in advance,

Joakim

I have the following for items for sale. The only rule is that the Jag, Jag
CD, and power pads must go together.
Here then, for your viewing pleasure is my list of Jag stuff. :)

Atari Jaguar with CD and 1 Power Pad, manuals, and boxes.

Cartridge Games:
Alien vs. Predator   Cybermorph   Fight for Life
Iron Soldier   Kasumi Ninja   Raiden
Rayman   Theme Park   Zool2
Trevor McFur in the Crescent Galaxy
Val d'Isere Skiing & Snowboarding

CD Games:
Blue Lightning   Myst   Vid Grid
BTW, I am not leaving the Atari scene.
.

You have to set bit 9 of the argument ev_mbclicks, e.g. to wait for both
left and right button set ev_mbmask to 256+2 (wait for max. a
double-click) and ev_mbmask to 3 (set bit 1 and 2).

YES... I knew there are people intressed....

im working very hard... i now have the desktop emulated.. i must now going
to emulate the blitter..... and that's a though wone.... i think it may take
a week or 3 ... then it's finished....

but.. i let know when it's finished

And it should also have been bit 8, not 9 ;) (the decimal value is correct, though)

Ciao

Thomas

>
> Any ideas?

Make sure the scheduler isn't called from both interrupts. For instance, if
the scheduler is only ever called from the 200 Hz interrupt (in an Atari),
the problem does not arise since the 200 Hz interrupt won't fire again
before many instructions from the first firing are executed. Other (higher
level) interrupts do not harm since they will clear the stack again before
execution resumes with your interrupt code.

Cheers Peter

Amazingly, these are the rare cases in which the use of hex
really makes sense ;-)

Cheers.
Henk.

Hi!
Can someone help me with a simple sourcecode for loading RSC-files in assembler.
My codes always crashes the computer.
I'm using Devpac 3 and using the Gemmacro.i library.

/Jeppe

Call the police is not done, but the law in my country is quite
clear: a refund in real money if the product doen not perform as

indicated on the parcel, in advertising etc.

But most managers and shop owners think that that law is not for them and you. And there are many lawyers taking up the case for the seller. And always loosing on court, but that they do not tell their customers....

If functioning/not funcioning can only be expirienced by opening the parcel, breaking the seal etc. then the story: 'it is opened and used' is not valid in court.

But who takes the trouble going to court? Only rich people can pay that.

Met vriendelijke groet,

>is impossible.

Depends on the complexity of the platform. Small, simple games can be
as near-as-dammit bug-free as it is possible to get. NOBODY can
guarantee 100% that it will run on any one particular system, though.
On the PC, developers simply have no way of knowing in advance what
other software you have installed or what other hardware you have
installed. (This is why Macs and consoles tend to get far fewer
problems with buggy software releases.)

As the platform becomes more complex - and the PC is about to have
two new hardware bus standards foisted upon it, as well as Rambus
technology - then the likelihood of a clash between different software
/ hardware combinations increases.

Someone asserted that Chaos Theory only applies to unknowable "natural
laws". Software *IS* a definition of laws for the computer to follow.
I've seen no valid reason why Chaos Theory should only apply to
"natural" laws, so I assert the view that Chaos Theory applies to *any*
area where some laws are unknowable.

On the PC, the developer has *NO WAY* of knowing which software laws
are being obeyed by your particular machine, so it is impossible to
ensure 100% perfection.

This isn't a perfect world.

>>2: IT *IS* POSSIBLE TO REFUSE TO BUY SOFTWARE THAT HAS BUGS IN IT.

>According to your first point, that would simply mean refusing to buy
>any software at all. ;-)

Not really. A well-programmed console game could be assumed to have a negligible number of bugs.

The point is to pick and choose which *grade* of bugs you're willing to put up with. Console games are simply not allowed to 'blue screen' the machine; they won't be passed by Sony / Nintendo / Sega's QA departments if they do. And there is very little excuse for doing so anyway, since a console is a single-tasking machine with a wholly known suite of software. (Barring anything the manufacturer isn't telling anyone about.)

On a PC, 'stupid' bugs should not be there. Stupid fatal errors of the "Oh look! My installer mis-copied some files, so I'd better crash the machine silly" variety. These are inexcusable, since these bugs are wholly under the developer's control.

However, it is possible that you may get a 'blue-screen' bug if you've just installed a swanky new graphics card (with its new, relatively untested drivers), which wasn't even designed at the time of a game's launch. In these cases, the fault actually lies in the hardware manufacturer, rather than the game. If you've only just bought the game, then you can still return it, since it no longer fulfills the "Merchantability" aspect of the unwritten contract between buyer and seller.

(IMPORTANT NOTE: I'm using my knowledge of UK (and some EU) laws and regulations here, since I know little of how the US retailing laws work. Presumably, the US has similar protection, but then again, it may not.)

>>Nobody - and I repeat: NOBODY - is forcing you to buy a buggy game at
>>gunpoint.

>I agree with that!

>>It is ALSO possible to return *ANY* game to the shop it was bought from
>>and ask for a refund, if you can prove it was "not of merchantable
>>quality". If a game is refusing to run on your PC, IT IS NOT SUITABLE
>>FOR THE PURPOSE FOR WHICH IT WAS BOUGHT, therefore you ARE entitled to
>>a refund.

>Well, of course you can always ASK for a refund. Just because
>something you bought doesn't do what you expected does not mean that
>you are entitled to a refund, though.

You are so entitled (in the UK, at least) if it the contract between buyer and seller is broken on the part of the seller. It is pretty f*cking obvious that you're buying a game to play on *YOUR* PC, so if the game fails to run on *YOUR* PC, the game is not of merchantable quality.

If your PC is a Pentium 166 MMX with all the trimmings, and the box states "Minimum Requirements: Pentium 75 with all the trimmings", then you are within your rights to assume it will work on your PC. This is part of the implicit contract between a buyer and a seller.

>I once bought a nylon rope to pull my car out of a snowy driveway. We
>tied it between the car and another, pulled, and got the car moving
>until it went off an embankment after cutting the rope on a bumper (I
>finally got a tow truck). I expected the rope to get my car out
>safely, but it didn't happen. It probably didn't say it would pull
>cars out of stuck positions and I took the risk that it might not work
>for my purpose when I bought it.

Irrelevant.

This is like complaining about a game not running on your 486, even though it quite clearly states: "Min. Spec.: Pentium III running at 500MHz" on the box. In these cases, "Caveat Emptor" applies; shopkeepers aren't expected to read minds, and neither are they expected to be experts in the field of computer games.

It is up to the *buyer* to ensure they have taken every precaution. If the information provided by the retailer was wrong, or misleading, (eg: if the 'minimum spec' is clearly grossly inaccurate), then you are within your rights to return it, since the fault lies with the retailer.

IMPORTANT NOTE #2: The 'contract' in any such case is between YOU (the buyer), and the retailer (the seller). AT NO POINT IS THE PUBLISHER OR DEVELOPER INVOLVED. If you find that the 'minimum specs' are incorrect, the retailer HAS to provide a refund. After that, it is up to the retailer to then take up the matter with the publisher or distributor, since that is a SEPARATE contract.

This aspect often confuses people, but is well worth bearing in mind. If your retailer insists that you send the box back 'directly to the publisher', then *they* are breaking the contract between you and they. On NO account should you do this, otherwise the law will deem you to have agreed to the retailer's terms, and your original contract will be null and void.

(Note that a contract can be legally binding, even if it only ever exists in verbal form.)

>If the label on the box guarantees that it will run on any class of
>systems that covers your computer, then take it back if it doesn't
>work. I have no problem with a business having a no-refunds policy.
>I just might choose to shop elsewhere. Caveat emptor.

I do have a problem. In the US, you may put up with that sort of thing. In the UK, it really is illegal for a computer games retailer (and most other classes of retailer) to have such a policy.

Don't forget, *about 50%* of the box price of any game *goes to the retailer*. The rest gets split (about 50/50) with the publisher and the distributor. The publisher then has to use its share to pay for the development costs.

When seen in that light, it's pretty obvious why many developers really wouldn't mind seeing online gaming and Internet distribution / retailing take off in a big way. Why have *three* middle-men when you can deal direct?

>>In most Western countries, this is a *statutory* right. Any computer
>>games retailer who operates a "No Refunds" policy should be reported
to
>>the police, as they are breaking the law.

>I seriously doubt that, especially if it was conspicuously posted.

Nope. Read the law.

Many unscrupulous retailers will try that ploy, if only to put off the wallflowers and cut down on their returns. But that doesn't make it legal; they just have to be caught doing it. (There's no actual law that says it's illegal to *display* such a sign, but there is a law which prevents it from being valid.)

However, in the US, your mileage may vary...

>>It's amazing how quickly the words "I'll see you..." and "...in
court"
>>can change the attitude of a shopkeeper. Especially when they're
>>pronounced clearly, succinctly, and *loudly* in front of an audience.

>You are right that most businesses would do that as a matter of
>maintaining good customer relationships.

And you'd be amazed at how few people would actually consider doing it.

*

There is a school of thought that believes "no refunds" retailers are only trying to prevent piracy. This is bullshit. Retailers couldn't care less, since they *never* lose out. They get to keep their share of the money, even for returned goods. The problem for them, is that it's a *hassle* to handle returns. They have to pay someone to pack it away, label the box, fill in forms, and so forth. Far easier to just try the "Which part of 'No Refunds' do you not understand?" ploy.

Not my strongest point these days!

>My codes always crashes the computer.

Daft question but i've done this myself many a time in C ...

Have you called appl_init and appl_exit correctly? ;-)

>I'm using Devpac 3 and using the Gemmacro.i library.

```
rscname:
dc.b "c.rsc"
dc.b 0
```

The size of these doesn't matter, as long as they are all big enough
...

```
global:       ds.w 15
control:  ds.w 5
intin:        ds.w 16
intout:       ds.w 2
intout:       ds.w 7
addrout:  ds.w 1
```

Now put their base addresses into an Aes Parameter Block ...

```
apb:
dc.l control
     global
     intin
     intout
     addrin
     addrout
```

The control arrays takes the rsrc_load opcode followed by the current
size of each of the intin,intout,addrin,addrout arrays ...

```
control[0] = 110
control[1] = 0
control[2] = 1
control[3] = 1
control[4] = 0
```

Shove the address of the resource file name here ...

```
addrin[0] = rscname
```

Address of apb -> d1

```
move.l   #apb,d1
```

Aes id code -> d0

```
move.l   #200,d0

trap 2
```

int_out[0] = result code (0 = error)

That's more or less it. If somebody else posts a better example then
go with that - I program in C and may have omitted something!

The House has a bill set up for a vote ASAP on whether to charge LD charges for Internet access even if you dial-up locally. This is something that affects each of us. Please read and forward:

Congress will be voting in less than two weeks. CNN stated that the Government would, in two weeks time, decide to allow or not allow a charge to your phone bill equal to a Long Distance call EACH time you access the Internet.

The address is http://www.house.gov/writerep/

If you choose, visit the address above and fill out the necessary form! If EACH one of us, forwards this message on to others in a hurry, we may be able to prevent this injustice from happening!

PLEASE PASS THIS ON!!!

Hello,

We are currently building a system using the Atari Falcon 030 and its internal DSP (Motorola 56001). We overclocked the DSP to 50MHz already, but we would like to have sampling be done at 44.1kHz at the input port (the mic port).

Our project consists of sampling a sound in real-time, apply HRTF filters to it and output the sound through the headphones port.

We really need to use the FDI, since it can provide a steady clock at 44.1kHz, which should provide CD quality sampling and output... We believe we will need some DEV_CONNECT commands, but we have not yet found more info on the web for the use of the FDI...

Any help, tips, URLs, examples, would be really appreciated.

Thank you in advance
Eric Desfonds
for Gilles Charron and Martin Khalife

Is somebody going to write a patch to fix the clock on the ST? On my

ST with TOS 1.4 the year goes to 2028 after 12/31/99. My TT doesn't seem to have this problem, but my ST does and I would like to get it fixed.

Are you really gonna use the ST after 2028? The quickest fix
would be to sell the ST and keep the TT. That's what I did. ;-)

I wish to use my 1040ST as a controller via the printer port. I was wondering if there are any sites/links for hardware information.
ie Port addresses, IRQ, etc

So programming links would be great.
Thanks

When Microsoft says they want to make a deal, it means they've already
screwed you and will now force you to approve of the event. Fair thee, be
warned, says I.

Your kidding, My TI-85 calculator can handle divide by zero error with out
crashing or corrupting data. I'd hate to think what would happen if the app
had to calculate the square root of -1.

It's true, here in California a man bought a dozen or so microsoft products and spent three weeks trying to install and run them. The experience convinced him never to use Microsoft again but, the store said they would only refund him for incomplete or damaged software after seven days. He tried arguing that the software was defective in it's 'complete' and 'undamaged' form. The courts agreed and the store was forced to give a refund to the man.

Why would you post to this to Acorn, OS/2, and Amiga programming newsgroups?
It's all Windows garbage.

People didn't die "as a result of computer failure". The *computers*
were only doing what they were bloody told to do. It was the "people"
who failed.

Indeed, rather a large number of people had been screaming at them NOT
to use the system, since it was known to be unsafe. The system was
built by a company called Electronic Data Systems ("EDS"), and this
particular company as a long, long record of fuck-ups. They still make
regular appearances in Private Eye.

(Does anyone know of a project they've actually managed to get
right?)

You never know, there are users who still use the Speccy and with MIDI
as standard, the ST is a cheap MIDI instrument;)

Why buy a dedicated word processor (the ones with vdu, printer etc.. in
one unit.), when for half the price you can buy an Atari, printer,
monitor and entertainment software thrown in and is liable to be
supported longer than them.

After all why did many programmers not think that computers would be
around after the year 2000!!!

I look forward in supporting the Atari range for many years to come, and
if they are still around when I pop my clogs, I hope my kids, kids will
take on where I left off.

when I reply to articles, I think and type at the same time, just like
you would when having a one sided conversation. So I have thoughts that
pop into the absent area between my tabs (northern/midlands slang ears).

Why can't the ST's OS ROM's be modified, as there are plenty of spaces
that could be used to squeeze an extra bit of code.

I've got a Unison EPROM programmer, of which the people who created the
beast have told me that I can do virtually anything I want copyright

wise! (they also said I can have all the development material when they can find them in their archives etc...)

Anyway, it's fine for the 27 series 28-pin dil EPROM's, what I could do with is and adapter that allows me to use 32-pin EPROM's manually switching between the blocks and plugs into the 2 ZIF sockets! or a programmer that can already take them!

--
Cheers! for now

>

>Try setting the date as dd/mm/yyyy

That won't help. The TOS in all STs upto, and including, TOS 2.06 have a problem with dates beyond 31/12/1999. As soon as the date is read from the keyboard clock, which the XBIOS uses, the date will jump to 2028. The same code exists in all the versions of TOS I've looked at, from 1.00 to 2.06, as well as Magic. There's only 3 ways round this. problem.

1: Load a patched version of TOS into RAM;
2: Use a patched version of Magic;
3: Find someone with an EPROM blower and blow a patched version of TOS into EPROMs.

ATM, I'm using the second of these, although once I get MiNT installed correctly, I'll have the problem back again :(

BTW, if you want some more info about the problem, Philip Taylor wrote a good explanation about it, and how to solve it, in article:

Hello!

I was wondering how you put controls (buttons, sliders, etc.) directly onto a window in a ST program. I know how to create dialog boxes with controls using a resource editor, but I've never been able to discover how to do the same thing with a window.

I have an old Mega 4 with TOS 1.4, but I have none of the problems you
describe. The clock on the control panel duly jumps to 01/01/00 from
12/31/1999 to 01/01/2000, and when I set it to February 28, 2000
23:59:59, it goes correctly to February 29, 2000 after a second.
There's nothing wrong here, no millennium problem whatsoever with my
ST.

Similarly, it amazes me how Microsoft and PC manufacturers had the nerve
of selling systems with the Y2K bug up until 1998. The entire computer
industry should be prosecuted for this instead of making money on
"upgrades".

Except that, Microsoft (and many others) have the following clause:
"offers no warranty against misusage nor that the product is fit for
particular intended purpose"

In other words, they don't tell you how it's intended to be used,
nor do they guarantee it's fit for that unspoken purpose. In plain
English: you buy, we make money. No questions asked nor answered.

Same here (patched German TOS 3.06) - yet I had problems convincing my
TT030 of the dates as it's DCF77 receiver software corrected it much
too fast.

Considering a lot of the network card drivers for Linux were developed
there, I'd say it's a good bet. :)

Linux has been used by LNL in their Loki and other systems for parallel
processing. I wouldn't be surprised if a lot of graphics rendering was
taking place on Linux platforms at places like NASA.

Mike.

Can anyone give me a list of things I need to build a cross compiling
environment for TOS to run under Linux?

Could egcs be used instead of gcc?

what about C/C++ libraries and GEM libraries?

David

In french law, that sort of thing doesn't protect them from the "vice
cach©" (hidden defects) regulations, that would apply here. I read an
interview in which the french minister responsable of fraud enforcement
was considering legal action in some such cases.

Does you Mega have a RTC built in? If it does, that could explain the
reason why you don't appear to have the same problem. AFAIK TOS looks to
see if there's a RTC and, if it there's one present, uses that to get
the time. If there isn't, it fetches the time from the keyboard.

It looks like the problem is going to only affect those STs without a
built in RTC which means that the pre-MegaSTs and the STE will be
affected. The MegaST(E)s, TTs and Falcons probably won't be affected.

In very short:

You create a window in which your dialogue fits.
Use wind_calc to get the outside measures from the inside.
You can specify all window gadgets including sliders and arrows
in 'wind_create'.

'wind_open' generates a redraw event which you can catch in
'evnt_multi', you then just draw the dialogue, using 'objc_draw'.
Allways by using the rectangle list!!

The best way to handle a dialogue in a window, is to turn form_do()
inside out and embed its inside calls in your own central
evnt_multi loop.

Henk.

P.S.
Set ob_x and ob_y of the dialogues root object allways
to x and y of the windows work area.
That's basicly the trick.

Henk.

If `RTC' means `real time clock', the answer is yes. But real time
clocks are standard in the Mega, as in the MegaSTE and TT and Falcon,
as far as I know.

How about using the open source "sox" package as a starting point and optimize
it if you think that you can speed it up?

Hi you all.

A new spring,
a new version of the this interactive disassembler.

You now can:

Mark 16 bit PC relative jumptables and generate corresponding labels.
Quick find the approppriate indirect jmp's and jsr's.
Give names to 'absolute word' operand addresses.
Give names to standard labels.
Attach a short comment to an address.

It is on my web page: http://people.a2000.nl/hrobbers/Homepage.html

Have fun

Henk Robbers.

- arrow bug fixed
- different logo shown after the machine is switched on
- WinX in ROM
- etc.

Thorsten

That could explain it then. It appears as though the machines without a
RTC are the ones that will be affected. Those with one probably won't
have any problems.

In some Operating Systems it does that. That's why I wrote a program
which handles setting the date with 4 digits

>believe we will need some DEV_CONNECT commands, but we have not yet
>found more info on the web for the use of the FDI...

The FDI interface is controled by the three General Purpose Input Output
pins on the DSP port.
First these pins are set to funtion as output:

```
     gpio(0,7);    /* Set al 3 GPIO pins to output */
```

Next you can select or change wich frequency will by used by the FDI:

```
     gpio(2,3);    /* Set FDI to use 48KHz clock */
     gpio(2,2);    /* Set FDI to use 44.1KHz clock */
     gpio(2,1);    /* Set FDI to use external clock e.g. 32KHz from DAT recorder*/
```

Now the sound matrix may be connected in the way you want to use it with
the sourceclock set to external and the prescaler set to 1.

>but we would like to have sampling be done at 44.1kHz at the input port
>(the mic port).
>
>Our project consists of sampling a sound in real-time, apply
>HRTF filters to it and output the sound through the headphones port.

For your setup this could look somethink like this:

```
     devconnect(adc, dsprec, srcclk, prescale, no_shake);
     devconnect(dspxmit, dac, srcclk, prescale, no_shake);
```

with:

```
adc = 3
dsprec = 2
dspxmit = 1
dac = 8
srcclk = 1
prescale = 1;
no_shake = 1
```

However I found out that there may be som problems with the adc using the
FDI clock. This can perhaps be solved by making some more connections on
the sound matrix. E.g. first connect the extinp to the dsprec and next
changing it to connect the adc to dsprec.
So try to fidle around a bit with the sources and destinations in the devconnect
command.

best regards, Arjan Bok

Never read Jason and the Argonauts? A classic from the early Greek era
if I remember correctly.

One who sailed on the ship Argo with Jason in search of the Golden
Fleece.
~~~~~~

Have fun, it's not worth it otherwise.

Copyright lasts author's life + 75 years. Every old video game falls under that, and copyright has NOT been lost due to age. "Abandoned" is a meaningless term, as copyrights do not get lost due to being 'abandoned'. [Trademarks can be lost if undefended, but that's a different legal concept.]

The creator of something has full control over their product, the audience has NONE. Get that into your mind, learn it, deal with it. If a sculptor says that their creation will be shown for a month at museum X, and then it'll be destroyed, THAT'S THEIR RIGHT TO DO SO. If a software company wants to never support or re-release something after its initial printing, THAT'S THEIR RIGHT TO DO SO. You have no right to argue with them, you have no rights to think better than them and decide how something should be distributed.

You want something to be available some years after it's released? Write it yourSELF, and put it under a license to freely copy. Get off your rear and start creating, instead of only lying about old titles.

Hi!
I have gathered team that's working on a Atari Jaguar shoot 'em up game.
Although the team looks quite good as for now, I am still looking for more skilful members. There are few spots for:

-Programmers(C & ASM)
-Graphic artists(2D or 3D, raytracing, modelling, painting etc.)
-Sound editors and musicians

I don't think I am able to pay you anything, but if you want to be a part of Jaguar's history, want to develop for a 64-bit machine, contact me.
Also, I'm sure this would help in future getting job in industry.

E-mail your applications to me, ville.jarvi@pp.inet.fi

Thanks!

Can an artist not destroy what he is unsatisfied with, while working on
something better? A game designer may feel that the first game was inferior
to a sequel or a later similar game, and want to remove it as something which
spoils the later work.

In the case of "The Great Space Race" (Legend, 1983), this is clearly a Good Thing.

> Some program however no longr have to
>copyrights on them and are listed as abandonware.

Bollocks. There's no such legally-recognised system.

The original copyright holders may waive their rights to the game *if asked first*, but this only converts the product to "Public Domain". Other copyright holders may require that the "Freeware" concept be used, where they still retain copyright, but waive any and all charges for the game.

Yet other copyright holders will say "no" - especially if they're persuing a possible sequel or update, or merely consider the game's release detrimental to their career prospects. In these cases, any copies of their software doing the rounds on the Internet are *illegal*.

Others have had their software uploaded to the Internet without their knowledge or permission. This is also illegal.

"Abandonware" is a portmanteau term used to denote software that computer game 'archeologists' believe to be unavailable from any source other than licensed owners of copies of said game. And which they believe should be considered 'Public Domain'.

These people are not infallible. In 99% of cases, the copyright holders can be tracked down after some effort, but it is not incumbent on the copyright holder to make him or herself available for this purpose at all times.

It should also be borne in mind that official museums for computer games do exist. The British Film Institute maintains one near it's Museum Of the Moving Image site on the South Bank complex in London. And these places would far rather see the original software in its original packaging; a feature that makes more sense for most researchers, since they get to see the product in context.

Neither is there anything inherently wrong with preventing further distribution of a product. Just because I released my game once, it is not incumbent on me to release it again at a later date. Copyright means it is my right to do with my game as I damned well please. Whether you like it or not.

It's also worth bearing in mind that piracy and cowboy publishers were a massive problem during the 8-bit and 16-bit eras. Because of this, copyright holders of 8-bit and 16-bit games tend to be wary of people asking them to just give their software away for free. (Especially when so many people did this anyway.) Because of this, some of the greatest 8-bit programmers are now working in offices writing database software and the like. It may not be as much fun, but at least they're getting paid top dollar for their skills.

I have part of an 8-bit game's copyright, and a 16-bit game's copyright to my name, both of which are utterly forgettable. (The latter made the front cover of ST Format, but this was when the Atari was already dying off.)

I personally consider the 8-bit game to be dire - especially as it was published before we'd finished it. I am not interested in seeing either of them 'preserved'. If you want my rights to my games that badly, you can pay me for them. Otherwise, live without. You're not missing much.

> By the way, what is
>argonaut?

Argonaut Software is owned by Jez San. They are based somewhere in North London (last time I looked), and are still a going concern.

They started out with Starglider for the Atari ST and Commodore Amiga. Later, they moved into consoles and were the designers responsible for the SNES' "StarFox" game (using a custom-designed 3D processor in the

cartridge). More recently, they created a few lacklustre PC games, and
are still involved with Nintendo.

I wrote a Year 2000 Countdown Clock program, but I would like to use the LCD digits that are located in the ASCII table at positions 16 through 25. Is there a way to print these characters to the screen? When I use PRINT CHR$(16) instead of printing the LCD 0 digit it does some sort of control function. Please give me a listing showing an example of how to print these digits to the screen. Maybe I have to load a different set of screen fonts, or do some sort of offset?

There you have this beautifull razorsharp modern screens, and you want
to stick to those early primitive mechanical operated 7 point
so called 'digital' digits ???? ;-)

Anyhow:
If you use GFA basic:
For PRINT all ascii below 32 are indeed control characters,
but not for TEXT
So
TEXT x,y,string$
will do it.
x,y are pixel positions.

Success
Henk

Many thanks to all the wizards here who helped me with my first GEM
program. It is running and doing more or less what I wanted... now,
if only the system I was controlling (X10) were more responsive, I'd
really have something here.

Special thanks to Ulrich and Swampdog for a lot of textual and binary
support.

I must say, after this brief but intense experience, that GEM programming blows Windows stuff out of the water. Of course, I'm biased, but having the screen objects as memory structures you can deal with directly is SO much more elegant than the Win32 API stuff that microslurp tries to hide from you with MFC.

In GFA I think you can use something like PRINT CHR$(255+16) if I
remember correctly.

iirc, you need to use Bconout with its handle changed from BC_CON to
BC_RAW. I forget the values for those names but no doubt it'll jog
someone else's memory.

As far as cross-compilers (if I understand your need correctly) is
concerned, about all I can think of is GCC. Never used it myself but
as it and sources are available for both machines then even if someone
else hasn't done it before, it should be possible to replace the PC
GCC code generator with a 68K one. Ditto the libraries.

Why not just run an emulator? That way you can test the code on the PC
as well?

I've been using Personal Finance Manager Plus 1.04 by Peter Veal for years now, and am very happy with it. One thing that's lacking though is the ability to import/export data in a common format ie. comma delimited etc.

Has anyone already written a import/export program that works with PFM+? If not, I might write one myself, and wondered if anyone knows the actual format of the .MNY file (it would save me having to dig around and guess). Anyone?

Gary

: actually.... well i need something that takes C code for ST/E and compiles
: it... AND IF POSSIBLE it would be running on DOS... so what i need is a C
: compiler that runs under DOS (or WinSton) and compiles to ST (PRG or TOS or
: whatever)..

2 Options:

- Get the sources for Sozobon C (should be on some FTP site somewhere,
  I got them once...) and compile these on a PC.
  The resulting binaries will run under DOS and simply generate Atari
  code, using the Atari libs. This should be fairly easy to do if you have
  a C-compiler for DOS.

- Compile GCC as a cross-compiler for DOS. This is _not_ a trivial task
  (The easiest way would be to use Linux and a DOS cross-compiler :-/)
  There might already be a m68k-TOS GCC cross-compiler available for DOS,
  though... (I know there is one for Linux)

OR you could indeed download Sozobon, GCC, Heat 'n Serve or C68 and install
and run it using an emulator. Not as fast, but a lot easier. :-)

No you can't.

Well, you could actually, if you had one of those very rare adapters
that were hardly ever sold and that use to cost nearly the price of a
new laser printer.

Once there were made interfaces that plugged into the Falcon and
bypassed totally that small SLM box. The thick printercable itself
went on the (I think ROM-port?) interface.

But never seem it any more the last years.

I remember because te programmers did not know about the two
different SLM804 series that are around.

In short, no. However, if you have a spare ST, then you can network
them together and share the printers. There are several utilities
to perform this.

Some who want to ride this high horse may need to learn something
about providing a quality product in exchange for bug-free money.

If I purchased version 1 in the box at retail price, why must I
buy version 2 -- which contains features that I may not care
about -- to get the bug fixes for version 1? And why did version
1 even get out the door with all those bugs?

I bought version 1 because it advertised features that would meet my need. The bugs were in my way and wasted my time. Why is my time -- wasted because of the developer's negligence -- worth nothing in this exchange?

If version 1 worked as advertised, it would still meet the needs I bought it for in the first place. Witness Quattro Pro version 1 for DOS -- I still use it. That hurt Borland, but I don't see software developers as charities to be funded for the betterment of humankind. They are vendors whom I expect to sell me a working product.

If an auto manufacturer sold cars that ran into the curb daily, there would be a national recall at their expense. If software crashes my computer daily, the vendor hides behind their disclaimer and offers to sell me the 'upgrade'. What is wrong with this picture?

Hi Sysops,

Please e-mail me, I want to connect the other side of the world again....
We have lost contact with lots of BBS systems overthere (USA/CANADA etc).
I am located in the Netherlands (EUROPE) and I want to network with all active systems.
Please mail me and we can set-up a network again....

Our network at this point includes 3 running boards in the Netherlands, 2 boards in Germany and at least 1 board in the USA (*this connection has been lost).

I am looking for the boards/network that is located in Sweden, Italy,

Canada,USA and other country's

PLEASE

Call +31-416-561927   300-19200   24hr/7days
-= The Underground Node #472 BBS =-   Running BBS Express Pro! 5.0b

Or e-mail to: SysopTXG@underground.demon.nl

When you are running another BBS and/or network on the 8-bit ATARI please
mail me, because we can
look if we can connect it by writting some converter software....

BBS Express Pro! can export and import QWK files so that could be one
solution but maybe there are
some other possibility's too...

Gtx,
Sysop*TXG

I think you attack another problem here:

* The original one is the problem of author's rights. I must agree with the cited statement that an author of something has full control over his product, while the audience has none. We (the audience) can not REQUEST of the author to give his creation away. If we believe that he has abandoned it or doesn't expect any profit from it anymore, we can just ASK POLITELY if he might be willing to make it free for everyone, so that its use may be prolonged, it may become widespread, etc. etc. (any plausible explanation). And then we should be grateful to him for being generous.

* It is quite a different problem what we (the buyers) get for our money when we purchase software. I quite agree with you that the present situation is humiliating because software author(s) usually make a disclaimer that amounts to a statement that he does not guarantee his software does anything at all, and you use it at your own risk. Moreover, in most cases, you do not actually buy software, you just buy the rights to use it. In some cases you may not even sell your copy to another user, because you are requested to fill-in the end-user-certificate (the purpose of this usually being to prevent politically-disliked users from getting advanced software).

Unfortunately, I think that by the act of paying for the software, and knowing of the said disclaimers and conditions, you actually agree to anything the author(s)/owner(s) request of you, and you have no more rights, except those explicitely stated in documents accompanying the sale.

On the other hand there are (rare) situations where you can actually BUY software, usually including the source code, and can do with it whatever you want and distribute it as you like. Some times that may be almost

equivalent to author's handing over his authorship to you.

And there ARE situations where the software is sold or licensed WITH a guarantee that it will do what it is advertised to do. For example, I think that the beautiful QNX real-time operating system for the PCs has some US-government certificates clearing its use in human-life-support devices and similar critical equipment. It may be said that this is practically a guarantee that it will do what it is told to do.

Cu.

1: IT IS IMPOSSIBLE TO CREATE 100% BUG-FREE SOFTWARE.

This isn't an excuse for lazy programming. It is a *scientifically proven FACT*. Computer programs are complex systems and, as such, just as liable to the whims of Chaos Theory as the weather. The more variables a programmer has to deal with, the more likelihood of bugs there will be. PERIOD.

Consoles have far fewer variables than Windows PCs. Even Macs, Unix, BeOS and Linux have far less hardware to cope with than Windows. Microsoft's very success is its biggest enemy. Windows has to cope with hardware and software combinations so numerous that you'd need a warehouse the size of *Texas* to contain PCs running every single possible permutation. It simply cannot be done at a reasonable cost.

The same problem applies to PC games. There is no way on Earth for a game developer to afford enough PCs and testers to test their games on every single permutation and combination of PC hardware and software available to their customers.

It is possible to buy two computers, each using *entirely* different sets of components (even the CPU doesn't need to come from Intel), yet they can both run most PC games.

Ask any well-informed IT expert and they'll assert that it's a bloody miracle PC software works *at all*.

2: IT *IS* POSSIBLE TO REFUSE TO BUY SOFTWARE THAT HAS BUGS IN IT.

Nobody - and I repeat: NOBODY - is forcing you to buy a buggy game at gunpoint. Good magazines *will* highlight major bugs. Frequenting newsgroups, and just listening to word-of mouth will also help you decide whether you're willing to put up with a game with "Known Problems" that will show up on your particular computer.

It is ALSO possible to return *ANY* game to the shop it was bought from and ask for a refund, if you can prove it was "not of merchantable quality". If a game is refusing to run on your PC, IT IS NOT SUITABLE FOR THE PURPOSE FOR WHICH IT WAS BOUGHT, therefore you ARE entitled to a refund.

In most Western countries, this is a *statutory* right. Any computer games retailer who operates a "No Refunds" policy should be reported to the police, as they are breaking the law.

It's amazing how quickly the words "I'll see you..." and "...in court" can change the attitude of a shopkeeper. Especially when they're pronounced clearly, succinctly, and *loudly* in front of an audience.

[...]

>If an auto manufacturer sold cars that ran into the curb daily,
>there would be a national recall at their expense.

Cars *do* run into curbs daily. They are guided missiles, with *humans* as the guides. As a design, the automobile is one of the most lethal ever to be allowed out in public.

Cars kill *hundreds* of people every damned day of the year. This, IMHO, is a MAJOR 'bug' - and one that sits at the design level, no less.

The technology ALREADY exists to prevent the vast majority of deaths by car, yet, like lambs to the slaughter, people *still* buy them.

Compared to automobiles, I'd say buggy games are an incredibly petty worry.

There are GDOS and NVDI drivers for this printer, and the good news is that
most serious software that doesn't use GDOS technology to print usually has
a driver included.

If you want to print plain text from the desktop then you should look out
for the LaserBrain Epson emulator and maybe the Diablo emulator from one of
the Atari FTP sites.

The drum and toner will be hard to get hold of nowadays.

Don't forget that a lot of vital machinery is controlled by software,
ranging from airplanes to nuclear power plants. Heaven help us if some
of the developers believe Microsofts claim that e.g. Windows NT is a
stable operating system.

<stimarco@solarflair.ndirect.co.uk> wrote:

>Computer programs are complex systems and, as such, just
>as liable to the whims of Chaos Theory as the weather.

My understanding of Chaos Theory is that it arises out of the
fact that things are unknowable on scales smaller than we can
deal with.

I am not aware that anyone has identified 'sub-bit' entities in
the software environment comparable to subatomic particles in the
physical world.

The smallest iota in the software environment is perceivable. To
the extent that Chaos Theory applies here it is not because
something is unknowable -- it is because sufficient effort has
not been made to make it known. And when enough things are
unknown and taken en masse, Chaos Theory may apply. This is a
novel form of expectation -- hoping for enough ignorance to make
a theory applicable.

What wound my watch here was someone talking loudly about the
rights of software developers when they demand payment and
disavow any responsibility for grief they cause me.

I paid for a machine that has firmware to support an operating

system that I bought to run applications that cost me money.
When an application hiccups and wastes days of my time, my job
just got harder because someone else -- whom I paid somewhere
along the way -- didn't do their job completely.

I didn't say their job was easy. If it were, anyone could do it.
Do they assume that my job is so easy or irrelevant that hiccups
don't matter?

I make enough of my own mistakes. I'm fortunate if I can sort
enough of those out. I don't need to sort out someone else's
mistakes to fill a quota.

Developers do well to bear in mind that my ability to pay for
'upgrades' is enhanced if I'm not wasting otherwise productive
time fighting their bugs -- or grousing about them on a ng.

In no way did I intend "they" to refer to Mr. Mates, to whose post I
initially reacted. I have no knowledge of any of his products. I
meant "they" in the generic sense. I switched references for my
pronouns at mid-sentence.

My apologies to Mr. Mates for any confusion. He did not contact me.
The sentence just seemed vague upon rereading it and I want to make it
clear that no personal attack was intended.

Nor did I mean to suggest that Mr.Baggaley has novel expectations. He
didn't contact me either ...

I hope that covers everyone. I am disturbed -- and inconvenienced --
by what I see as an industry mindset. Any perceived personal barbs
are unintentional.

I have heard of a story (I believe it's true as it came from a reliable
source) about a US Warship which was modified to run WinNT as it's OS.
It had to be towed back to port when the OS crashed.

Hi Nathan,

> If a sculptor says that their creation will be shown for a month at
> museum X, and then it'll be destroyed, THAT'S THEIR RIGHT TO DO SO.

That isn't the truth. Copyright exists in the _form_ of a work, and is completely seperate from ownership of the materials.

A copyright holder has no particular right to insist that a lawfully copied work must be destroyed.

> If a software company wants to never support or re-release something
> after its initial printing, THAT'S THEIR RIGHT TO DO SO. You have no
> right to argue with them, you have no rights to think better than
> them and decide how something should be distributed.

You always have the right to argue -- one of democracies greatest virtues and greatest vices. At the end of the day, if a software house is no longer making any money from a work and nor would it loose any money from the copying of a work then the public are pretty much free to do with it as they please. There is no element of criminality, and British courts do not award punitive damages in civil cases. The most a Copyright holder could do is get an injunction, and TBH who is going to be so minded when there is no money but only ill sentiment to be gained?

Deal with reason and reason will deal with you, that is after all what law is all about.

John.

Argonaut also came up with some really fast 3D software libraries for
the PC, which it was going to sell to Microsoft. Just before they
signed a deal, Microsoft shafted them by picking someone else's
software. And that is the story of Direct3D, so I heard.

It was called "BRender", was ludicrously overhyped and, because it came out just before decent 3D accelerators came onto the market, it proved to be nowhere near as useful as they thought it was. (Remember the dire 'FX Fighter' game?) It was about as popular as a pyromaniac in a fireworks factory, and appears to have been put to sleep.

MS bought up a 3D library created by US-based Rendermorphics. That, too, was a steaming pile of overrated shite. It exists in DirectX as part of the legacy, universally-loathed, 'Retained Mode' portion of Direct3D. Most use the far superior 'Immediate Mode' Direct3D API routines, as these provide much more powerful facilities. (It is unlikely that 'Retained Mode' will be maintained to any great degree, since MS and SGI are apparently working on a replacement scene management API based on OpenGL.)

Well, yes and no.

The warship was the Yorktown, which was the test ship for the Navy's SmartShip program. This ship is part of an X-program, similar to the Air Force' X-1 through X-15. One way to state the charter of an X-program is, "If it ain't broke, you didn't push it hard enough." IOW, the entire point of the exercise is not to prove that it works, but to quickly and fairly inexpensively test stuff you think might not work. Find out early the areas where your group's knowledge is weak so that you can focus attention and funds on those areas. The SmartShip program is years from being considered ready for installation. It's pre-alpha software.

I believe that the specific fault was a divide by zero in a database application that crashed the app and corrupted a database to the point

where it couldn't be fixed on-site. It's unclear to me whether that
crashed the OS itself.

If you're interested check out
http://www.jerrypournelle.com/REPORTS/JERRYP/Yorktown.html for some
correspondence on the incident with pointers to more info.

Scheduled Chat Sessions

Click the Main Chat Room menu option to join us for the scheduled
chats. Chats are schedule every Saturday night at 8:00PM CST.
Please stop by for a while. Note the special chat nights listed
below.

Saturday, March 13th 8:00pm (Central Standard Time USA)
We invite Roger Burrows, Anodyne Software, maker of
ExtenDOS to join us to discuss his newest software and support
of other Atari products as he champions one of the biggest aspects
 of current Atari users--compatibility.

THAT TONIGHT ON HTTP://WWW.ATARIUSERS.COM/AUNT

(PS: We would like to set up a chat session during the European hours

for our site since many have voiced an interest. If you would like to
be our guest or know of someone who would be a good guest speaker,
contact me at   clu-da-bard@geocities.com)

Windows and NT are not mission critical OS's -- you will not see either
running a launch of the space shuttle in the near future.

Yes, complex programs are harder to implement correctly than simple
programs. That doesn't support your hypothesis that bug-free software
is impossible.

>2: IT *IS* POSSIBLE TO REFUSE TO BUY SOFTWARE THAT HAS BUGS IN IT.

According to your first point, that would simply mean refusing to buy any software at all. ;-)

>Nobody - and I repeat: NOBODY - is forcing you to buy a buggy game at
>gunpoint.

I agree with that!

>It is ALSO possible to return *ANY* game to the shop it was bought from
>and ask for a refund, if you can prove it was "not of merchantable
>quality". If a game is refusing to run on your PC, IT IS NOT SUITABLE
>FOR THE PURPOSE FOR WHICH IT WAS BOUGHT, therefore you ARE entitled to
>a refund.

Well, of course you can always ASK for a refund. Just because something you bought doesn't do what you expected does not mean that you are entitled to a refund, though.

I once bought a nylon rope to pull my car out of a snowy driveway. We tied it between the car and another, pulled, and got the car moving until it went off an embankment after cutting the rope on a bumper (I finally got a tow truck). I expected the rope to get my car out safely, but it didn't happen. It probably didn't say it would pull cars out of stuck positions and I took the risk that it might not work for my purpose when I bought it.

If the label on the box guarantees that it will run on any class of systems that covers your computer, then take it back if it doesn't work. I have no problem with a business having a no-refunds policy. I just might choose to shop elsewhere. Caveat emptor.

>In most Western countries, this is a *statutory* right. Any computer
>games retailer who operates a "No Refunds" policy should be reported to
>the police, as they are breaking the law.

I seriously doubt that, especially if it was conspicuously posted.

>It's amazing how quickly the words "I'll see you..." and "...in court"
>can change the attitude of a shopkeeper. Especially when they're
>pronounced clearly, succinctly, and *loudly* in front of an audience.

You are right that most businesses would do that as a matter of maintaining good customer relationships.

Thad

What was so bad about FX Fighter? I got a copy of that in a cd bundle,
and it wasn't too bad - I'm not a big fan of fighting games, but it
seemed alright.

Quentin.

>way I want: pixel reducing!

It is possible to reduce the picture size. Under the 'Extra' menu select
'Preseting'. Enter the scaling, e.g.. for 640x480 to 64x48 enter for (X)
10 and for (Y) 10 and click okay. Then under the 'File' menu select 'Not
Show'. This will ensure that when you open the picture it will save it
back out at the reduced size in the default format for the colour depth.

To alter the default, select 'Saving Dflt' under the 'Extra' menu.
Clicking on the format produces a dialog box where you can pick the
required format. When you've selected the required formats, close the
dialog and load in the picture required. Gemview will then load it in,
reduce the size and save it back out again.

There is an adaptor you can buy called AT Keys (I think). It's
a while a go since I read about this device but I think it
replaces or at least overrides the Atari keyboard controller
and allows you to connect PC keyboards.

At Keys is available from System Solutions

http://www.system-solutions.co.uk/cafe

Regards,

Ben Hills.

Ronals asked on 18 Feb 99;

>Is there software to change (reduce) the number of pixels in a
>picture?

Yes there is, and I know this is becoming very boring:
PHOTOLINE; load in the pic go to option Scale Pic, set the
wanted dimensions, click OK and save your new scaled pic...

Cheers from Belgium

Dennis

I found an old book in a secondhand bookshop called Mark Williams C for the
Atari ST (so I bought it). Anyone have a copy of the actual programmes ? Any
chance of emailing them to me ? Thanks, John McDermott.

I'm still working on my DLL manager for TOS that I mentioned in this
newsgroup a year or two ago.

It is almost ready for alpha release, however I still have a bit left to
do on the user manuals (the programmer manuals for the engine, and how to

write a library are OK).

(I'd intended to have it released mid/late 1998, but some restructuring and optimisations delayed this)

As well as being a librarian, it has some non-library functionality - like manipulating the cookie jar, getting TOS info, getting info about the computer it is running on (RAM/CPU) and so forth.

Are there any features that you would like to see in this or a future version?

ATM there are functions to detect if a library is already loaded, to load and unload a library, to "link" to an already loaded library, to enumerate all current libraries, get info about an on-disc library, and to test a library (to see if it is "ok")

It can handle about 40 loaded libraries (based on a unique library name - when you add links to already loaded libraries this figure increases to many hundreds). This figure (40 physical libraries) will be raised in the future if/when I get around to capacity-torturing it.

The Toolbox consumes 32k of disc. and 32k of RAM plus whatever memory the libraries require.

--

All email sent to my inca address will fail, however I can now be contacted via an intermediary : gem at tos pl net. I would like to apologise to the genuine respondents that this may inconvenience.

problem is that this product is commercial, so i'm amazed that you
havn't disks with the book.

If you want to do something with a picture that doesn't include
actual drawing, chances are good MGIF (FreeWare) will do it (and often
faster than the alternatives ;-).

When it comes to scaling, you have a choice of filtered or unfiltered
(you could apply a smoothing filter beforehand too if you want), so it
should work fine for you.

MGIF loads GIF, Targa, JPEG and a few other formats and will save as
for example GIF or Targa (currently not JPEG, though).

Hi!
I own this issue of COMPUTE! magazine (dated April 8, 1988, it was titled "COMPUTE!'s Best of Atari"). It came with a software DISK inside, which is lost (contained SpeedScript, and other programs).
Does anyone have this original Disk, that I can BUY? Or, If you own it, but don't want to sell it, can I possibly obtain a COPY?
Thanks,

Gosh, I have looked at that many times, but never realised the real
meaning of 'zoom'. Thanks for this 'how to do'. Especially this last
trick was why I did not find out.

>
>To alter the default, select 'Saving Dflt' under the 'Extra' menu.

I had some trouble entering values for X and Y. Try-out gave me
to type: 00100010 for getting 10 and 10 in both. Seemingly a small
bug/feature?

>Clicking on the format produces a dialog box where you can pick the

Well, I guess the subject line says it all! :)

Maybe it is obvious, but I haven't found out how yet. Changing state
of objects is easy enough, but I don't know how to fix this.

Help?
Oh, and I use GFA-basic 3.6

Regards,

Joakim

I think the apeface he is referring to is the old SIO to Parallel Printer
interface. You connect the Atari8 SIO port to a standard IBM-compatible
parallel printer. I used to have an Epson RX-80 w/graftrax connected to my
800xl via an Apeface. I used to print nice stuff to it through the old G:
device driver thing. I still have this gdevice software around here if you
have an Epson printer.

  Joakim H⍰gberg wrote on Thu 25-02-99 21:23 (GMT):

> Well, I guess the subject line says it all! :)

OB_FLAGS(tree%,obj&)=BSET(OB_FLAGS(tree%,obj&),x)
OB_FLAGS(tree%,obj&)=BCLR(OB_FLAGS(tree%,obj&),x)

resp. to set the bit x in the flag for the object number obj& in the
tree number tree%, and to clear the same bit.

(I'm just beginning to play with those things :-))

Bye,
/Pascal/

I want to thank you all very much for your help. I've now managed to make my game switch between user mode and supervisor mode when needed. During this process I found several bugs in my program, that didn't show when running in supervisor mode all the time, and when in user mode they made the game crasch. So now almost everything seems to be ok.

Regards
Henrik

Greetings all,

Thanks to replies here, everything seems to work,
BUT if I redraws part of the object-tree after changing the flags,
eg. change an object from default on to default off, it won't show it
until I close that window, and then later reopen it.

Why?

Thanks in advance,

Joakim

Thanks for all the great help on sliders and resource editors! I've got
some sliders working, and a big step up on my project.

Got some more questions, though...

1. Are there undocumented function calls in the GEMfast library?
In the AES documentation in the Compendium, the description of wind_create is something like
   wind_create(int type, int x, int y, int w, int h);

In the example source that came with H&S, however, it is
   wind_create(int type, GRECT xywh);

Is this actually a different call (in which case the GEMfast implementation of wind_create is not documented), or does GRECT just happen to get stacked in the xywh order?

2. Now I'm ready for the real work. Serial (aux) port: Call Bconout to transmit a byte. The external device handshakes, so loop on Bconstat until something arrives, then call Bconin and mask off the LSB. How far off am I?

Then I see the Iorec function, which makes me wonder if the system doesn't pull bytes off the port and put them into a buffer automatically. Or even, you put outgoing bytes into a buffer and the system transmits them for you. The explanation in the Compendium is awful light. With the handshaking that this protocol involves (for the most part) and the small amounts of data being transferred, I don't really want to set up an ISR.

ob_flags is handled exactly the same as ob_state, except you're
referencing a different member of the OBJECT tree, and use different
bitmask names of course!

The answer lies in the problem ...

>Why?

... you can manipulate the OBJECT directly all you want but no visual

changes will be seen until *something* causes the object to be
redrawn. Closing and reopening the window initiates a WM_REDRAW. Thus,
you should perform your changes then send yourself a WM_REDRAW.

Incidentally, to speed things up a little you might consider a
WM_REDRAW clipped to the object you've changed but note that things
extending outward of the ob_x,ob_y,ob_width,ob_height area of an
object can become a headache. Tip: find the object's parent and redraw
clipped to *it* plus its children. ;-)

I don't think you understand the work "compile".

The code

```
PRINT "This is basic code"
PRINT "Press a key to exit."
~INP(2)
STOP
```

is GFA Basic code. When you save it, TOS cannot and willnot understand it. Only GFA Basic will.

In order to make it executable code (TOS will run it in) you need to compile it. I personnaly use Minuq Tranquille - it's postcardware and very good. (Get it on good programming CDs/Disks) - although GFA have released their own compiler.

You cannot uncompile executable code, but it can be passed on without any other file.

The GFA editor actully DOES compile it into memory, so you can test it. It is no quicker than it takes to compile normally. It's the writing to the disk which takes time. (If you use minuq tranquille, then you'll notice it says "Passed test 1" through to "passed test 3"
test 1 is checking it exists, and that it'll load into memory (It does it)
test 2 is compiling it into memory
test 3 is writing the finished product to disk.

I know this isn't REALLY programming, or Atari, but when you think about

it, it is...

Is there any way of clearing the frames in a web site in the anchor tag?

Yes, of course, and this has always been done from within the code.

```

GRECT is ...

```
typedef struct     {
int  g_x,g_y,
     g_w,g_h
}    GRECT;
```

MWC uses ...

```
typedef struct     {
```

```
int  x,y,
     w,h;
}    Rect;
```

... but they're both the same thing: same size structure: same components etc.

Yes. You are correct about the stacking. Standard C stacks arguments right to left, so those int's get pushed 'h,w,y,x'. Thus they end up with 'x' at the lowest memory address, which matches the storage of the GRECT on the stack ...

```
GRECT    g;
SP -= sizeof(GRECT);
*SP = g;  /* ie memcpy(SP,&g,sizeof(GRECT)); */
```

Incidentally it'll work elsewhere ...

```
Rect r    ={1,2,3,4};
printf("%d %d %d %d\n",r);
```

... saves a fair bit of typing for those debugging statements!

Tbh the disks are pretty useless without the book. I've been using MWC
for over a decade and still refer to it. Besides, a concerted effort
sometime back failed to find anybody who had the copyright. There's
been the odd posting in usenet from one or two who used to work there:
apparently many sources got corrupted.

The compiler Minuq Tranquille that you speak of is in fact not a real compiler but a clever hack of the gfa-basic runtime program. You think it's compiled but what it really does it append the runtime program directly to your source code. In fact if you was to give me a program compiled with this so called compiler I can extract your source code from it intact. I'm not joking here I have investigated this free compiler. If you get the real compiler from GFA your programs will run some magnitude faster!

>You cannot uncompile executable code, but it can be passed on without
>any other file.

See above, I can if you use that fake compiler! Send me a compiled program I will send you back your source code if you don't believe me. ;-)

>The GFA editor actully DOES compile it into memory, so you can test it.

The editor does not compile, it runs the program interpreted, meaning each basic token is looked up on the fly and some asm code is executed.... this is slow. Compiling it will change the entire file into all asm and the tokens will be gone, thus it's faster.

Greetings all,

I have (once again) a little problem.
I wonder how I can find out if the current AES is capable of more than one application? (In GFA if possible) :)

Thanks in advance,

Joakim

Got the bit with RS232 figured out. The Rsconf documentation was a little off; it says it returns the ucr/rsr/tsr/scr in a packed longword with ucr in the MSbyte; in actuality, ucr came out in byte 1 (second LSB).

Incidentally, yes, I know using Bconin/Bconout/Bconstat is low-level, but it should be portable, and I couldn't figure how to do a timeout waiting for input. All the high-level input functions (e.g. fgetc) will wait forever for a character to arrive, and there is no such thing as EOF for stdaux.

Got another:

I start a (standard) dialog, in this particular case with the easy frm_dialog function in the GEMfast libraries. Comes up, I can punch the buttons, and things work right. However, I have some radio buttons and edit fields that I want to update and redisplay without dismissing the dialog. I can successfully select buttons and copy strings to objects, evidenced by what I see if I call the dialog up again, but I can't redraw the dialog while it is still up. objc_draw executes and returns "no error," but the screen is unaffected. What am I doing wrong?

This is what I'm experiencing, too, I think. Is this for dialogs?
If I draw my object tree in a window, I can update the objects
(individually or collectively) any time. But if I create a dialog,
I can't redraw objects; new settings appear only if I dismiss the
dialog and call it back up again.

AESglobal[1] (I don't know what it's called in GFA) contains the number
of possible concurrent applications. If it's -1 (MultiTOS, N.AES) there's
no limit.

No, this was for objects in windows.

When eg. changing an object from default on to default off, I hadn't realized
I had to redraw from parent object to make it visible that the default border
was gone. Now works fine! :)

Greetings all,

After looking into some source-code found on FTPs,
I suspect this call is the one I'm looking for in GFA.
Can anyone confirm this?

```
ap_id&=APPL_INIT()
a& = DPEEK(GB+6)   <-- This one?
IF a& = -1
     ~MENU_REGISTER(ap_id&,"  My Program");
ENDIF
```

Thanks in advance,

Joakim

Thanks, this is exactly what I wanted. Just wish I knew to make this call from GFA.

It was originally released by Borland Germany as Turbo C. The programmers then broke it off from Borland, renamed it Pure C, and sold it through Application Systems. It is no longer being made, however.

What about OGJC_CHANGE ? It can set the OB_STATE then perform a redraw
in a single instruction.

Bye,
/Pascal/

Cher ami(e)s Ataristes,

Depuis maintenant 2 ans nous travaillons sur un projet
de creer un "Kit de developpement pour Jaguar" pour Falcon Atari.

Celui-ci etant aujourd'hui tres avance, les logiciels sont globalement
operationnels et une nouvelle carte avec des capacites tres avancees
est en cours de finalisation de conception. Nous vous invitons a venir
visiter notre site pour decouvrir un peu plus le-dit projet.

Si notre projet ne vous interesse pas, veuillez nous l'informer afin
que nous vous effacons de notre mailing-list.

Vos reactions nous interressent, contactez nous.

L'equipe Jaguar,
Laurent et Sebastien FAVARD: atari@linux.utc.fr

Dears friends Ataristes,

Since 2 years now, we work to make a "Jaguar Development Kit"
for Atari Falcon.

This one is now very advanced, softwares are ready and a board with
large capabilities is being in final design. We encouraged you to visit
our dedicated Web pages to discover a little more about this project.

If our project doesn't interest you, please contact us to remove your
email from this mailing-list.

Your reactions interrest us, contact us.

Jaguar Team

multitask!=WORD{{GB+4}+2}<>1
that's all :) should do it.

Here some extra:

```
deskacc&=({ADD(BASEPAGE,36)}=0)         ! if your app is an acc
compiled!=BYTE{BASEPAGE+256}<>96        ! if your app was run from editor,
                                        ! or was compiled.
function aes$
  local a$,a&
  a$=HEX$(DPEEK(LPEEK(GB+4)))
  return a$
endfunc

ap_id&=APPL_INIT()
if ap_id&=-1
  error do whatever
  ~APPL_EXIT()
endif

if deskacc&
  print "was ran as acc"
else
  print "was ran as prog"
endif
```

Extra hint: don't use the GFA builtin commands, 3/4th of them are
buggy.(at least)
don't use the line-a calls, and don't use the menu_register() of GFA, or
even exist()

Hope this helps.

Hello,

does anybody know about an image format with the extension .64k??
I have loads of medical MR-images I would like to convert but I am not
even able to see them, because I lack a viewer for these images.

Is this any "official" data format, or is it something created by an
individual for his personal use? In other words, has anybody ever heard
of this format?

Thanks a lot,

Uli

But still VERY usable! Some knowledge in german language helps a lot
though.
    Mr.Pink of Reservoir Dogs even made sources for game/demo
routines available for Pure C (also some older ones for HiSoft's C) at
http://rg.atari.org

ogrammer,comp.os.msdos.programmer,comp.programming,,comp.sys.amiga.programmer,comp
.sys.atari.programmer,

Hello,

I would like to hear some opinions on the following :

I've often wondered what will eventually remain of all
older/early games, tools, operating systems, ... that once
enjoyed users of Sinclair, Atari, Amiga, Commodore, ... ?
Even the first releases of OS/2, Photoshop or whatever would
be a waste if never to be available anymore.

Even if most of them are already long forgotten and maybe even
not available anymore, there are certainly several issues when
this software would be freely distributed.

There is the matter of copyright of course.

Secondly some minor groups are still selling this older software.
Their offer however is often very, very limited and it is by far
not always clear what the origin of the software is.
Despite these efforts I'm afraid a lot of software already
can only be found in diskboxes in some people's attic.
If would in fact be very strange if version 1.x would endanger
the sales of version 3+ of whatever.
Recently 1.x versions of several of Borlands development tools
were included with some magazines... .

Third issue are the developers. Distributing this old software
is said to discourage them of writing new software. Boy, those oldie
sure were very good ! With some very good emulators today, it could
on the contrary be catchy to write some new stuff.
If available, the source of some oldies could also be interesting
material
for debuting developers in my opinion (anybody from Argonaut still out
there ?). Curious what Linux and Be porting teams would make of
the code of oldies (Dan Bricklin's Visicalc remastered ;-)))).

It would already be a nice if some of the companies still in business
released their older versions (wonder whether Sierra still has King's
Quest 1 for the Atari in their cellar ;-))).
What about companies that already vanished over the years ?

Geert

If you are looking at my old GFA program mtosname (or something along those lines). Then yes that is addressing the global array to detect if you are running under multitos (as per the standards of the day, when I wrote it). With a map of the global array and that, you should be able to get anything you need.

I often ask myself the same questions. There is only a certain amount of copies of every program. Eventually they will deteriorate or be damaged and there ends the life of that program. Some program however no longr have to copyrights on them and are listed as abandonware. By the way, what is argonaut?

What a stupid decision, IMO. The biggest thing the Phenix has to worry about is it having no credability due to repeated delays, and the fact that by the time that it is finally released people will have either jumped ship, or bought Milans....

This is almost as bad as Wizztronics...

Newsgroups: comp.sys.atari.programmer

Greetings,
I'm new to GEM programming and I'm having problems trying to get a program started. I'm using Hisoft's HISpeed Pascal, mostly because I can't get G++ working, but that's of course another post. I can't seem how to put whatever the user types into a TEDINFO block into a variable. My docs are useless for it, and I've tried everything. Here's one of the procedures I'm writing that requires it. Basically, the program is a setup for a login/password program that will give standard TOS users the ability to configure different environments much like Window$ does. Anyway, I appreciate and thank anyone in advance who can help me with this, or at least point me in the right direction.

Thank you in advance,
George Garner

P.S.> Here's the program block...

```
Procedure do_add_new;
{Handles the input for adding a user.}
   var
      ch: char;
      x, y, w, h, object: integer;
      a, address: pointer;
      pass: pointer;
      password: string;
      return: LongInt;
      temp: text;
   begin
      rsrc_gaddr(R_TREE, USER_PASS_DIAL, address);
      form_center(address,x,y,w,h);

      form_dial(FMD_START, 0,LASTOB,0,0,x,y,w,h);
      objc_draw(address,0,20,x,y,0,0);

      object:= form_do(address,0);

{****** I just need to know how to retrieve the login name and
password from what the user enters.  Again, any ability to point me in
the right direction is greatly appreciated *******}
```

```
      rsrc_gaddr(R_TEDINFO, LOGIN_INPUT, password);

      form_dial(FMD_FINISH, 0,LASTOB,0,0,x,y,w,h);

      rsrc_gaddr(R_TREE, MENUBAR, address);
      menu_tnormal(address,USER_MENU,1);
   end;
```

I have no experience with Pascal under GEM, but it's possible that
your problem is caused by you using Pascal-type strings and the AES
returns C-strings. Isn't there any examples in the HiSoft-package you
can look at?

Circa 28-Jan-99 22:20:02, the ineffable Arthur T. Murray, aka
uj797@victoria.tc.ca, commited the following text to public scrutiny:

ATM> "phineas" <phineas@NOSPAM.demon.co.uk> contributed on 28 Jan 1999:

p>> When out of my head on "comp.sys.amiga.programmer", this remark by
p>> lwickjr@i2k.com still made some sense:

LW>>> I don't know how far along development currently is, as I haven't
LW>>> begun the port yet [FORTH is too low-level and write-mostly to port
LW>>> easily to other languages,

p>> Hmmm, FORTH used to be fun on the Sinclair Spectrum... #:)=

Likewise on the C=64. *8{) I must admit, however, that it isn't easily
readable after having not programmed in it in several years.

LW>>> and I don't yet have the ARexx source he's posted to Aminet, because
LW>>> I don't yet know where on Aminet to look for it],

p>> Allow me:

ATM> Mindrx941126.lha misc/misc 52K 211+Amiga AI public-domain work-in-progress.
ATM> MindRexx.lha util/rexx 21K 265+Project Mentifex's AI prototype
ATM> Mindrx.lha util/rexx 28K 230+Project Mentifex's Arexx based AI design

ATM> http://www.geocities.com/Athens/Agora/7256/m-forth.html Mind.forth is
ATM> already superior to the 26nov1994 Mind.rexx referred to above.

I still need a starting point for my port, and since ARexx is closer in style to Python than is Forth, I prefer to start with Mind.Rexx, rather than Mind.Forth.

ATM> Mind.rexx is an example of patching things together with chewing gum
ATM> and Band-Aids. REXX (or Amiga ARexx as used in Mind.rexx) imposes no
ATM> discipline on the programmer, while Forth demands and ensures
ATM> hierarchical structured programming.

Not strictly true: FORTH also gives you all the tools you need to throw the rules of hierarchical structured programming out the window. One can write spaghetti code in ANY programming language.

ATM> You will notice a very peculiar thing about this "pdaimind" code.
ATM> Until Mind.forth has "quickened" or attained a minimal
ATM> functionality, all the strategic planning in the program will remain
ATM> opaque and senseless to you, even if small segments of the code make
ATM> sense.

Be careful, Mr. MindMaker: saying things like that is an open invitation for people to limber up their flamethrowers. Remember that it is _possible_ that the program as a whole may remain sensless, even to a programmer who has studied the source, successfully ported it to another language, and fully understands what everything does.

ATM> As soon as "Snow Crash" gets through "Burn Rate" to "Code Complete",

What do these terms mean?

ATM> two distinct phenomena will become operative. People who run the AI
ATM> program will see exactly what it is doing -- and whether it even
ATM> truly qualifies as AI. More importantly -- especially for such a
ATM> fragile, brittle program as an artificial mind -- people with a lot
ATM> more smarts than very truly yours Arthur/mentifex will be motivated
ATM> to see what Mind.forth does: break concepts down into AI playdough.

Your code already provides plenty of opportunity for people who run the unfinished code to see exactly what it is doing -- and whether it qualifies as AI.

Some people, myself included, are already motivated to see what the PDAI Mind does --and does NOT-- do. I hope that the program gets more --rather than less-- interesting as it nears compleation.

See ya on the Bit Stream! The Hungry Hacker, looking for work. Got any?

* Despite the high cost of living, it remains popular.

I sent a message to it but there is no reply..Has it changed it's
email?

I posted a message to it about a problem with the STE extension in
Stos. When I load Stos from my Hard Drive (tower with CD Rom), It
bombs out as soon as it trys to load the STE extension. I know the
extension is not corrupt because it loads ok from floppy disk. Anyone
know what the problem is? I use Extendos to mount the CD drive and I
have partitions C to G.

That's wrong. Many people think that the CENTurbo II doesn't exist and
we
do it... For Phenix, it's the same thing: we work very hard and
WE WILL FINSIH the Phenix too.

Pascal does not interface well to anything written in C, which Gem is. It needs some tools to overcome these problems. They probably exist and you'll need to find them.

```
>I can't seem how to put whatever the user types into a TEDINFO block

>   begin
>      rsrc_gaddr(R_TREE, USER_PASS_DIAL, address);
>      form_center(address,x,y,w,h);
```

How is form_center declared? See if 'address' is a 'pointer' or something else like 'object'. The latter would indicate this pascal has the potential to access fields directly, though the former doesn't exclude it.

```
>      form_dial(FMD_START, 0,LASTOB,0,0,x,y,w,h);
>      objc_draw(address,0,20,x,y,0,0);

>      object:= form_do(address,0);
>
>{****** I just need to know how to retrieve the login name and
```

>password from what the user enters. Again, any ability to point me in
>the right direction is greatly appreciated *******}

I assume it works up until the next line?

```
>      rsrc_gaddr(R_TEDINFO, LOGIN_INPUT, password);
```

There's all manner of things that could be wrong above. We'd need to see the declaration of rsrc_gaddr to even stand a chance of figuring it out.

a)
The Pascal 'string' and the C string are not compatible.

b)
The Gem rsrc_gaddr returns pointers to things - lots of different things depending on the 1st arg.

c)
I'm not convinced Gem rsrc_gaddr works properly for some of its sub-opcodes. Hence I use R_TREE then access directly (could be wrong, might be my compiler or just my memory).

d)
What, if anything, does the Pascal rsrc_gaddr do with the result from the Gem rsrc_gaddr before it comes back here?

```
>      form_dial(FMD_FINISH, 0,LASTOB,0,0,x,y,w,h);
>
>      rsrc_gaddr(R_TREE, MENUBAR, address);
>      menu_tnormal(address,USER_MENU,1);
>   end;
```

> time.. ;) Do I have to send the AV_SERVER some message for it to
> recognize my prog as a client?

Yes, of course. How do you think Thing should know about your window,
if not told by your program? (*)

Thus, you have to register via AV_PROTOKOLL, tell the server about new
windows with AV_ACCWINDOPEN, use AV_ACCWINDCLOSE when a window is
closed, and send AV_EXIT on termination.

Ciao

Thomas

P.S.: Followup-To: set

(*) Yes, I know this is also possible using WF_OWNER, but not all AESes
    support this mode for wind_get()

Ok, thanks! Sorry for asking this kind of basic questions, but I haven't been able to find any english docs that explains AVprotocol from scratch.

regards,

Joakim

Well, what did you miss in the English translation of the Thing
hypertext? I'll try to improve the docs, if possible.

Ciao

Thomas

Has anyone out there got a good GFA Basic manual? I'm looking for one which
covers Graphics and Graphic commands. I've undertaken a bit of work with GFA
and need to graph arrays of data. I'm not very familiar with GFA so would
appreciate anyone with working knowledge of GFA to drop me a line and any
Graphic programs which might help me.
Thanks

What I needed was a very detailed description on how to use AVPROTOCOL, and maybe the doc⍰s in THING are aimed at people who know how the basics work already. Apart from that, I believe there is nothing missing in the THING doc⍰s.

Since I⍰m a bit new to programming here, things are seldom that obvious to me. :) Therefore I am very greatful for all help and hints given to me in this group..

Regards,

Joakim

Anyone tried em all or know of a faq about C programming on
the Atari.

What freeware ones are available. How much worse are they to
commercial offerrings.

Which is fastest etc, least buggy, 68030 optimised?

Any info

Was Hisoft C (compiler version) ever given away on a
coverdisk? Is it worth finding anyway?

What about C++

Hi,

I have bought a Falcon030, and I stopped programming on PC! It really
S@*&#&@!!! So I will go back to
my ATARI and program it again. I am already programming the 8-bit computers
in assembly but I need
some convertors and write them my self on the Falcon030 and I am looking for
a complete PASCAL
compiler, I have used Borland&Turbo-pascal on PC..... Is there a similar
compiler on Falcon030 ?

Gtx,
Rene

Greetings all,

I'm a bit ashamed of this, but I must admit I still haven't managed to get the global window cycling working. I am definetly doing something very wrong here. I guess I'm doing something fundamentally wrong, so I'll write down how I have tried to do this.. ..please don't laugh.. :)

Am I right when I say that this is always true:

word0 = id of reciever
word1 = id of sender

and that othe values depends on message type?

This is how I tried to do things:

On open window
send AV_ACCWINDOPEN to avserver:

word 0 &H4724
word 1 ap_id& (client)
word 3 window handle

On CTRL-W
send AV_SENDKEY to avserver:

word 0 &H4710
word 1 ap_id&
word 3 &H0004
word 4 &H1107

It works fine when sending CTRL-W to avserver, but it seems like
THING never understands the AV_ACCWINDOPEN. Perhaps it is also worth
mentioning that I use GFA and not C.

Anyway, thanks for any help I get here. Much appreciated!
Once again, sorry for not having the basics cleared out, but I'm
here to learn.. ;)

Regards,

Joakim

Hi!

Joakim H?gberg <gokmase@hem1.passagen.se> wrote:
> Am I right when I say that this is always true:

> word0 = id of reciever
> word1 = id of sender

No, the first word is the message, the receiver is given in the call to
appl_write(), but looking at your examples below, it seems you've just
got it wrong in your question, not the code ;)

> On open window
> send AV_ACCWINDOPEN to avserver:

> word 0 &H4724
> word 1 ap_id& (client)
> word 3 window handle

This looks OK, but don't forget to zero all other fields, especially
word 2.

> On CTRL-W
> send AV_SENDKEY to avserver:

> word 0 &H4710
> word 1 ap_id&
> word 3 &H0004
> word 4 &H1107

word 4 should be &H1117, as the ASCII value for ^W is 23 (&H17), not 7.
It may still work, but you should correct it.

> It works fine when sending CTRL-W to avserver, but it seems like
> THING never understands the AV_ACCWINDOPEN. Perhaps it is also worth
> mentioning that I use GFA and not C.

Well, _did_ you register via AV_PROTOKOLL (don't ask me why PROTOKOLL is
spelled German, whereas all other messages have English names)? If you
don't, Thing will simply ignore your windows. This is necessary because
in a multitasking environment, forgetting to unregister a window before
exiting (for example because the program simply crahses) would then lead
to confusion when another client with the same application ID gets
active.

Also note that Thing (nor any other AV server I know of) does not
directly top your window (this would be very bad style), but sends a
WM_TOPPED message to your application, just as if the user had clicked
into the window to top it.

Ciao

Thomas

Ok, maybe I□m wrong here, but I think that it said 1107 in the english thing.hyp? (I don□t have my atari here right now, so I can□t check that)

Anyway, I will change this right away.

> Well, _did_ you register via AV_PROTOKOLL (don't ask me why PROTOKOLL is

> don't, Thing will simply ignore your windows. This is necessary because

Nope, this was not done before. Didn□t realize it was necessary, even though I was going to add this call later to be sure what functions are supported. So, I guess that was the reason thing would care about the windows then.

Yep, no problem with that.

Thanks a lot for all your help, Thomas! It has been *very* valuable!

Regards,

Joakim

I have HiSoft C Interpreter for sale, this allows you to write program
and try them out, just like you could in BASIC. It is not a compiler.

I also have Lattice C v5 & v5.6 for sale, use this in conjunction with
HiSoft's C interpreter so you can write, & test programs with one, and
then compile it when done.

I have also some other C packages. If you want to know more drop me a
line.

This is what you usually find in argv[0], but I'm not sure whether
this is the case with TOS (I've never needed this). Anyone?

Hi Joakim!

JH>I wonder whether or not it is possible to determine from within a
JH>program what its own filename is? Is so, how?
Here's an extract from the Fcntl man page:
--- >8 schnipp 8<

Fcntl(2) Aug. 5, 1993 Fcntl(2)

NAME
  Fcntl - perform various control operations on a file

SYNOPSIS
  #include <filesys.h>

  LONG Fcntl(WORD fh, LONG arg, WORD cmd);

DESCRIPTION
  Fcntl performs various control operations on the open file
  with GEMDOS file handle fh. The specific command to per-
  form is given by cmd; the possible commands are given by
  symbolic constants in filesys.h, and are listed below.
  arg is an argument whose meaning depends on the command.

  The following commands are applicable to any file descrip-
  tor:

[...]

  PLOADINFO
    Returns information about the parameters passed to
    Pexec to start this process. arg should be a

```
pointer to a structure with the following format:
struct ploadinfo {
    short fnamelen; /* length of fname field */
    char *cmdlin;   /* must point to 128 bytes, to be filled in
                     with the process' command line */
    char *fname;    /* must point to "fnamelen" bytes, to be
                     filled in with the full path+name of
                     the file from which the process was
                     launched */
}
```

The data pointed to by the structure elements will be filled in with the appropriate data for this process. If the process's full name and path are too long to fit into the provided space, ENAMETOO LONG will be returned. On success, a 0 is returned.

[...]

RETURNS

0 or a positive number if successful (for most commands; but see the specific descriptions above).

EIHNDL if fh is not a valid GEMDOS open handle.

EINVFN if the specified command is not valid for this file handle

Some other (LONG) negative error number if an error occurs; different commands may recognize different possible errors.

SEE ALSO

Fdup(2), Flock(2), Fopen(2), Fxattr(2), Pgetpgrp(2), Psetpgrp(2)

BUGS

Very little error checking is done. In particular, ownership of terminals is not properly checked, nor is read/write access to the files. Do not rely on this bug; it will be fixed some day.

File locking is not yet implemented for some file systems.

---------- >8 schnapp 8<

Bye

Joerg

Hi Clair,

> How can I put a file into alphabetical order? I can't use external
> programs (I know of a program which can do it) because it's a PC
> program. (Spit)

The simplest of ways is to use a bubble sort routine. Basically, you go down the list, comparing two entries at a time and if they are not in order then swap them. You repeat this process until you make one complete pass of the data where no swaps are needed, hence the data is sorted. I am not a great basic expert but here is some pseudo-code for the algorithm.

```
loop
    flag = 0
    i = 0
    loop
       if string[i] > string[i+1]   *
            tempstring = string[i]
            string[i] = string[i+1]
            string[i+1] = tempstring
            flag = 1
       i = i +1
    until i > max_data
while flag = 1
```

* How you compare the strings will depend on what functions are available in basic. In C you would use strcmp(), but you may have to write your own comparator. N.B. that you should ensure your function thinks A=a, unless you require otherwise.

John.

Hi Martin,

> Was Hisoft C (compiler version) ever given away on a
> coverdisk? Is it worth finding anyway?

Lattice was never given away on a cover disk. It is well worth finding, it is by far the best commercial C compiler ever made. Unfortunately, it had a very limited distribution and Pure C is the most popular, however, it didn't find much support in the UK.

Given the choice I would opt for Lattice everytime, but if you plan to incorporate other people's libraries into your software, they are invariably written in Pure C and that is probably the software to go for.

> What about C++

Only one I know of is G++, from GNU, it's big and requires lots of memory.

John.

|> this is the case with TOS (I've never needed this). Anyone?

It's possible. MiNT uses it to determine if the memory protection should be
turned on or not (MINT.PRG or MINTNP.PRG). Have a look at the sources if you
have them (in boot.c or main.c or something like that).
If not, try

```
#include <osbind.h>
void main(int argc, char **argv)
{
Cconws(argv[0]);
Bconin(2);
}
```

and see what it prints ...
good luck

Vincent

A new update of JagStudio is available at:

http://wwwlinux.utc.fr/~atari/atari.html

this one have got now two JagStudio version, for MagiC and TOS/MiNT.
Site always in French, we expect do an english version as soon as
possible.

Hi Vincent!

VB>It's possible. MiNT uses it to determine if the memory protection
VB>should be turned on or not (MINT.PRG or MINTNP.PRG). Have a look at
VB>the sources if you have them (in boot.c or main.c or something like that).
It's in main.c. there also is a comment which explains how it works, but also
says why this should not be done by other programs:

```
-------------------------------- >8 schnipp 8<
--------------------------------
   /* When executing AUTO folder programs, the ROM TOS locates
    * all programs using Fsfirst/Fsnext; by peeking into our
    * parent's (the AUTO-execute process's) DTA area, we can
    * find out our own name...
    * This works with all known (to me) TOS versions prior to
    * MultiTOS; but I don't think any other programs should use
    * this trick, since MiNT or another OS with memory protection
    * could already be running! <mk>
-------------------------------- >8 schnapp 8<
--------------------------------
```

VB>If not, try
VB>#include <osbind.h>
VB>void main(int argc, char **argv)
VB>{
VB>Cconws(argv[0]);
VB>Bconin(2);
VB>}
AFAIK this also doesn't work everywhere too

I think there's no "global" solution to this problem

Bye

Joerg

Hi,

Does anyone know where to get Basic sources for the 8-bit Atari on the net?
I mean for example games listings that used to be published in magazines
back in the 80's.

Thanks!

I am building libraries for GFA Basic to include hooks to MiNT Operating system.
These will include Processes that will identify and change Pid and Prio,
File locking and any other useful extensions.

If anyone has been working in this area and would like to share your results,
Please email me what you have done. When completed, I will place on FTP site,
as soon as my domain gets moved.

Thanks

If your program is passed the environment from the parent program,
which it should, then ARGV = "your program name" .
This is an environment variable.

This could get tricky if the program doesn't have any idea of the
environment it is running in??? If it does then that'll make things
much easier.

As Jo stated, argv[0] is the standard way for C programs. Sadly it
relies on the parent to set it correctly. Command shells do but
standard Gem/TOS will not - it'll be empty.

You got me curious.
I ran a small appliction to read program memory in TOS.
Text, Data, and BSS do not include program name.
Basepage and command line do not either.
Memory control blocks don't as well.
DTA does not.
Unless you have a parent program that passes in ENV, I don't think
you can know your program name, unless you code it to the program
itself.
Other than that, build a small general purpose program loaded that
you can run applications from, that will pass the child NAME.
Or, better yet, use something like Mint O/S and applications will have
an environment passed.

Hello,

I am learning to use C on the ST (Heat N Serve variety of Sozobon) for a quicky job that just aches for a cheap ST. I've been meaning to do this for a while; now I've got an excuse!

Anyways, my question involves slider controls. In Mircrosoft VC++, these are easy; predefined dialog objects. They don't appear to be predefined under GEM. How do you do sliders? My best guess at this point is a headerless window with a vertical slide bar and nothing else, which would have to be overtly constructed in code and placed on the dialog. Is there a better way? (I hope...)

Hello again,
  Second question: As long as I'm learning C and stumbling around with the object trees that the resource editor constructs, I've gotten some "free" resource editors, such as RSC30 and MKRS and ORCS, most of which (of course) are in German, and I'm playing around with them, but not extremely pleased. I've seen a commercial offering mentioned here, but can't remember the name. OR, if someone has a recommendation for a different "free" one that isn't present on Umich.

  Also, these editors seem to focus on the monochrome screen. Given that "modern" TOS is usually in color, say, on a Falcon screen, are there resource editors to construct dialogs in color?

The commercial one is Interface.

Why not look for RSM? The last version I have is 2.11 but it may have been superceded now.

There's usually a solution. Taking into account I've been up all
night, off the top of my head ...

Newer Gem's could use appl_search using the ID gained from appl_init.
Command line progs get it anyway. Older Gem's virtually guarantee the
current working directory will be the same as the executable so you
could do worse than FsFirst(".*.xxx",FA_ARC | FA_RON) where 'xxx' is
the program's extender. There's the _PNAM environmental as well but I
can't for life of me recall the contexts in which it exists atm.

So roughly ...

```
IF argv[0] BLANK
     THEN TRY appl_search
     ELSE Do FsFirst
```

ENDIF

Needs enhancing by someone less sleepy of course! ;-)

By "dialogs" are we talking Windoze ones or Gem ones?

Gem ones are modal like Windoze ones with an important difference:
they are modal to the system. While *any* (ie "the only") dialog is
being displayed all other applications will grind to a halt at the
point they attempt to initiate changes to the screen (via the AES). A
dialog cannot receive messages so all other applications are blocked,
even in pre-emptive multitasking Gem operating systems!

Incidentally, this is why modern apps now place their dialogs into a
window: to let other apps can continue.

All that matters here is the question - is your dialog in a window or is it a standard dialog? It's a bit difficult to answer below without knowing.

> Anyways, my question involves slider controls. In Mircrosoft VC++,

About all I can say atm is objects in the Gem OBJECT tree do not possess their own handles: ie they are not capable of receiving their own messages. It works more on the basis of

Gem keeps track of mouse
"what is under the mouse?"
message -> app
(possible) enquire object
app does something
app (probably) tells Gem to invoke visual changes.

Like I said, trying to explain both dialogs, in & out of windows, will just lead in circles. ;-)

Yes, Interface.

You can put shading patterns to good use here. Design the initial resource in mono then load it in colour and change the colour values from BLACK to whatever. Mono resources will always display, reguardless of colour depth. Moreover, Gem will display anything which isn't in the background colour as BLACK if that colour does not exist in the current display rez. Even better, the mono colour indices map onto the 4 colour ones, and the 4 colour ones map onto the 16 colour ones. Ditto 256, the 1st 16 are the same.

Granted specifically designed resources look best but quite satisfactory results can be obtained via successive modifications to a mono resource.

If you don't know your program's file name, how would you know if
you have found the file with FxFirst. I guess you could read
Data,Text, and BSS of file tested to compare with your Basepage info.
appl_search no good until Tos 4.04.

In the long run, it would be a whole lot simpler for the programer
to code in the program name. After thinking about this, what purpose
would this have anyway.

Hi!

I have programmed some network stuff that uses STinG. I have discovered
that, for some reason, STinG doesn't work properly when the computer
runs in supervisor mode.

In user mode, all works fine when calling CNbyte_count() for example.
But in supervisor mode the computer just freezes.

I read in the Atari Compendium that supervisor mode should be used
sparingly under MiNT, because no task switching can occur. Does this

apply to STinG too, and if so why?

Regards
/Henrik Gild

Do not call CNbyte_count() from supervisor mode.

If anything goes wrong when in supervisor mode
then the system halts.
Supervisor mode is only for the OS and device drivers.
So as you read in the Atari Compendium only use supervisor mode sparingly .

Martin Wilson (martin.w6@REMOVEukonline.co.uk) wrote:

: What freeware ones are available.

There are several:

- GNU C (GCC)
  Very good, can generate code for just about any processor (so that includes 030 code), does good optimizing.
  Drawbacks can be the command line user-interface (you'll want to use a shell like BASH with this), it't not really easy to install if you don't know much about UNIX-oid systems, you'll probably need to have a MiNT filesystem and it uses quite a lot of memory (at least 2 Mb needed for old versions, 4 Mb for newer versions, but 14 Mb reccommended for serious use)

- Sozobon C, extended version
  Pro's: Nice and small, produces compact code, fairly fast, will run on any Atari machine, uses standard DRI object file format.
  Cons: Not fully ANSI compatible, support for 32-bit ints is a bit buggy (usually only a problem when porting UNIX stuff...), some of the GEM bindings are a bit non-standard (again, only a problem when porting other GEM code, sometimes...), no 030 optimization.

- Heat 'n Serve C and others.
  Similar to Sozobon, not very well known... Some are proper ANSI though and support the Sozobon libs.

: How much worse are they to commercial offerrings.

Usually not much, sometimes even better.
The biggest difference is the interface: commercial compilers all have a GEM shell, the free ones only do commandlines.
Also, there are a lot of libs available for Pure C and Lattice C, these can't be used with the other compilers if the source isn't available.
(although you could try disassembling them :-)
There are tons of code available for GCC though, mostly UNIX stuff.

: Which is fastest etc, least buggy, 68030 optimised?

Least buggy, probably: GCC (newer versions), and maybe Lattice C?

Fastest: Commercial compilers and maybe Sozobon

: What about C++

Only one option: GCC (or G++, actually). G++ is a _real_ memory-pig
though, and can be _very_ slow, even on a 75 Mhz Pentium...

I doubt that the method you describe will work.
Slider bars are usually created out of various other objects (boxes,
buttons) and are handled manually by the application. This is tedious stuff,
I know...
I've been working on a modular non-modal GEM dialog lib for Sozobon C for a
while, which would make handling things like sliders and lists and dialogs
in general _a lot_ easier. I have had to stop development for a few months
due to other projects (ethernet-adapter driver) though...
If you want to know more about programming GEM studd, I suggest you read
"Professional GEM" by Tim Oren. It can be downloaded from my site
(atari.scum.org) or many atari FTP sites.

I got RSM a little while back. Can't remember the version number. It
looks pretty good, does everything I would expect, EXCEPT how to save
the .h file. There's a dialog for setting that capability, I think
(dang, those German words are LONG!), but setting it, not setting it,
and whatever I did to the "HRD" option got me a .hrd file, but never a
.h file! Maybe that would have been a better question - how do I get a
.h out of RSM? Without that, it's nice, but not too useful.

Yes. I discovered that re-reading the tutorial, so my direction right now is to put the dialog in a window. Which isn't really a dialog (in the GEM sense, I take it), but the graphic elements of the dialog drawn in the window. If this is the case, then the controls (like buttons and my sliders) aren't really controls, but objects being altered under program control as mouse messages are received.

While I'm asking, getting a dialog up on the screen is fairly well described in the literature. And getting text onto a window is fairly well described in some example source I've got. But how to put those graphical elements (described in the object tree) into a window - I could use a nudge in the right direction!

This is another question whose time has come: If making sliders (and such things) is a pain, are there solutions available? I know I've seen sliders on very old apps and ACCs, so the problem HAS been solved, probably many times. I would be interested in your library, or maybe another not-so-well developed one.

Hello,

  The CENTurbo II rev B will come, an update of the software package is
done:
  CBOOT 1.1.0
  CENTvidel 3.2.4
  VIDEOMOD 1.2.2
  CENTscreen 3.4.6
  FLASH.BIN 1.2.6
  Cecile demo 1.95

  The new version correct some few bugs and bring a lot of new
functionnality notably
in CENTscreen. The last development of Dolmen make this soft to
evolve...

  For the Phenix, a modification of the bloc diagram was achieved.

Hello All,
    I have a program that calculates digits of the irrational number Pi by Carey Bloodworth. It's a great program and is the fastest program of it's kind currently available. I would like to make it available for as many platforms as possible including Atari ST/Falcon! Unfortunately I do not have access to a machine with Atari ST/Falcon on it or even one with a Atari ST/Falcon cross compiler. So I would very much appreciate it if someone running Atari ST/Falcon could compile the source and send the executables for me to post on the web.
    The source is currently available at http://www.geocities.com/EnchantedForest/5815/pi_agm_src.tgz . Compiling it should be simple since it has already compiled under many OS's with no modifications. The only thing you need to do is compile the pi.c

file. All the other (2) files are included from there. If you have cc
you can just execute the build script. It would be very nice if the
program could be compiled with some standard optimizations (like -O3)
and the executable sent to me compressed in a standard compression
format (like zip). I hope this is not too much to ask. Thanks in
advance.

Dara Hazeghi
hazeghi@2xtreme.net

P.S. More information on the program can be found at
http://www.geocities.com/EnchantedForest/5815/program.html .

!!

You are right, what funny behaviour. If you take an existing resource
file you cannot get it to produce a .H file when you 'Save As'.

However, if you are working with a new file it is produced OK.

There is an English translation if you want to go further. Look for
rsm211e.ZIP.

Hi.
My name is Jeppe and I just got my Atari up from my cellar (where it's been the last 6 years or so).
I've used to do a lot of stuff in Gfabasic, and now I've started a new programmingproject in Gfa.
My main interest is theatre and theatrelight (showlight), and therefor

I've stared just two days ago developing a software to control showlighting.
Lighting tables is very expensive (from $1000 upto $40000).

My idea is to create a software that can control the same light an

normal size lighttable can (say like a normal $3000-class table).
This software uses MIDI and the MSC 1.01 protocol for superbe
light control.
The MIDI protocol also have features to control CD-decks, video-
projectors, advanced light (like motorised and such), colorchangers,
stroboscopes, haze, smoke, moving lights (like discostuff).

The program I started with is a simple lightcontrol for Atari
ST-computers, that can be compared to that $3000-table.
You can get the Atari for $100-200 with monitor today and
the software can be sold cheep - thatway Atari can compare
to large advanced and EXPENSIVE systems.

It's terrible boring to do this by my self and never get any great
feedback.

I would like to get in contact (by email) with someone that is
good at GFA. I know all about MSC-protocol and lighting, and
a lot about GFA.
So no knowledge of MSC or digital lightingprotocols is
needed, just the extra GFA help.

Electric gretts

Newsgroups: comp.sys.atari.programmer

Hi,

I'm not sure how to start this question.

Has anyone heard of the IEEE1394 interface (aka Firewire) ?

It is a new type of high-speed peripheral interface capable of very high
data speeds, I think the design is capable of 250Mb/s.

The interface is also flexible, allowing many devices to be connected and
daisy-chained (~125) and cable lengths can be long (~4.5m)

Oddly the first devices to use this interface have been digital cameras, both still and video. It can of course be used on hard-disks, CD-ROMS, DVD, video, etc., etc.

One of the first applications has been video editing. From a digital video camcorder the image & sound data can be uploaded onto a fast hard-disk (~3.5Mb/s). Using software, the image sequences can then be edited like on a traditional edit desk and the resulting edit can then be downloaded onto a fresh digital video tape in the original camcorder (or any other IEEE1394 device).

All this sounds wonderful to someone like myself who has spent days with an edit desk, a camcorder, a VHS deck and dozens of cables.

Alas, this interface was designed by Apple so they were the first to offer it on their computers. However, there are now PCI - IEEE1394 cards available from companies such as Adaptec suitable for the Milan, Mac and pc.

There is even a TOS based editing suite available called Mountain from France (TNT),
sadly it doesn't handle sound yet.

The only item missing from the jigsaw is the driver necessary to handle the PCI-IEEE1394 card.

I must confess at this point that I write software for a living but I have never got to grips with the Atari (typical isn't it) and I wouldn't know where to start to write a device driver. I guess some specs. are needed or maybe some sample code from the manufacturer.

I am hoping that some of the experts out there may take this on as it seems a natural extension to the HD device drivers and CD ROM drivers.

Is anyone interested ?

regards,

Peter.

Hi there,

  dlormand@aztec.asu.edu:
 > these are easy; predefined dialog objects. They don't appear to be
 > predefined under GEM. How do you do sliders?

Make two touchexit buttons in your dialog box, these will be your up and down scrollers. You can get the arrow charactes by pressing CTRL and I think A for up and B for down. For the slider part make one box for the outline and another as the actual slider, put the slider box inside the outline. Now align these up so they look nice in the resource editor.

In your program, simply adjust the size and position of the slider box as appropriate.

John.

You can look on my webpages for some GFA utilities I have made or some I have posted that were made by others. I don't really have time to

take on other projects as I have too many going already. However I
can maybe give advice or tips about GFA-Basic itself, since I use it
alot.

You'll need at least some info on PCI interfacing for the machine you want
to use (a Milan, was it?). The manufacturer should be able to provide you
with those.

: I guess some specs. are needed or
: maybe some sample code from the manufacturer.

Yes, you'll need that as well. You can also check if device drivers exist
or are being developed for Linux, you could use some of that code (only if
you release the driver under GPL)

Most drivers on the Atari are implemented using a "cookie", which points to

a structure which can contain version numbers, values and pointers to interface functions which can then be used by other programs or higher-level drivers. Examples of cookie use can be found for instance in the CBHD SCSI driver package.

The levels could look something like:

1. PCI interface driver (this one probably already exists)
2. IEEE1394 card driver (which uses the level 1. PCI driver)
3. Video/HD/transfer/network/etc. driver, which uses... etc.
4. User software

: I am hoping that some of the experts out there may take this on

Hope so too. :-)
I'm already busy writing a device driver for another type of device...

: as it seems a
: natural extension to the HD device drivers and CD ROM drivers.

: Is anyone interested ?

: regards,

: Peter.

>graphical elements (described in the object tree) into a window - I could
>use a nudge in the right direction!

All the positions of the objects in a tree are relative co-ordinates,
so to position the tree in a window all you need do is modify the
co-ords of the tree ROOT object so they match those of the window work
area (WF_WORKXYWH). eg AES moves window ...

You catch WM_MOVED. The message buffer will have WF_FULLXYWH in it.
Convert this to WF_WORKXYWH, either by wind_get(WF_WORKXYWH), or
calculate it directly via wind_calc(). Set ob[ROOT].ob_x,ob[ROOT].ob_y
to the x,y co-ords from WF_WORKXYWH.

Now these changes need to be made visual. Either call your window
redraw code directly, or (as I prefer) have your app send itself a
WM_REDRAW message for that window.

The redraw code needs to do the usual WF_FIRSTXYWH,WF_NEXTXYWH stuff
where you simply use objc_draw over and over again until you've
"walked all the rectangles". The clipping rectangle for objc_draw is
that returned by WF_FIRSTXYWH,WF_NEXTXYWH. You've finished walking
when you get a clipping rectangle with zero width and height.

User interaction with the dialog is a little trickier. It'll need to

be handled by evnt_multi() and you'll be looking at the MU_BUTTON
event initially (MU_KEYBD as well later). When an MU_BUTTON occurs do
an objc_find() using the mouse co-ords. As to what you do with the
object under the mouse is entirely up to you!

Implementing the editable fields is a pita. I suggest that be left to
one side for a while.

Why not take a look at WDialog
http://home.t-online.de/home/ToBeHome/Software.html

The archive includes some good example code aswell.

I can't say that I've used it yet myself, but it looked well thought out.

Later,
Karl.

There is a lot of software around to convert from one picture format
to another.

I use 800 x 600 pixels true-color compressed TARGA pictures.

I want them on the home-page.
The are about 1 Mb each, so that is a no-go.

First I have to convert them to something like JPEG or PNG or
whatever that is in fashion nowadays.

But I stll end up with big files. And with to many pixels when they
come on-screen.
I need something of 100 x 75 pixels on the www-page.

Is there software to change (reduce) the number of pixels in a
picture?

Met vriendelijke groet,
Ronald van der Kamp

After extracting the files sozbin14.zoo, sozbin15.zoo, sozlib15.zoo,
sozutil09.zoo, sozc6844.lzh and mntsox44.zoo I set the following environment
variables:

```
PATH=C:\SOZDISTR\BIN\
SOZBIN=C:\SOZDISTR\BIN\
LIBDIR=C:\SOZDISTR\LIB\
INCLUDEDIR=C:\SOZDISTR\INCLUDE\
```

Compilation of test.c ...

```
#include<stdio.h>

int main()
{
  printf("Hello, world!\n");
  return 0;
}
```

... shows that my Installation of Sozobon-C cannot find stdio.h!

Did I install the wrong files / versions or are there some more
env-variables to set?

Thanks for help, Didi.

Could be all manner of reasons.

>In user mode, all works fine when calling CNbyte_count() for example.
>But in supervisor mode the computer just freezes.

It's best to keep your program in user mode all the time. Just shift
to superstate only when necessary, then revert back.

>I read in the Atari Compendium that supervisor mode should be used
>sparingly under MiNT, because no task switching can occur.

None of the Atari operating systems (to my knowledge) will multitask
whilst the system is in superstate. Offhand I've a vague recollection
the AES can't be called from superstate either.

>Does this
>apply to STinG too, and if so why?

Interrupts. Atari more or less decided they could mess with them as
they pleased while the cpu was in superstate.

Sounds like the most probable cause is an incorrect environmental
variable. Wild guess - INCDIR.

```

Might also be worth trying INCLUDE as well. The #include<> name does
seem to vary its name around different compilers.

I just started some web pages specifically for GFA-Basic. It's
up now and working I hope.

Great!

There haven't been all that many sites about GFA, so this is very welcome!
Very nice with some source-code to learn from. Keep up the good work! :)

Regards,

Joakim

Who are you asking, Steve? If you are looking for v7.xx then the ROM web-site says that they expect it to be available end-Feb (but ... it wasn't so long ago that they were expecting it end-Sep 98!!).

There are THREE versions of Atari BASIC Computing Language, as follows:
Atari CXL4002   79 BASIC Computing Language [ver. A]   C
Atari CXL4002 ?81 BASIC Computing Language [ver. B]   ER
Atari CXL4002   85 BASIC Computing Language [ver. C]   R
One of my BASIC carts is not dated, but instead has "R 39 2" stamped (you know, "recessed") into the front of the cart (in very small letters). How can I know if it is the version "A" (common) cart, or if it is the version "B" (Extremely Rare) cart? I also definitely own a copy of the version "C" cart, because the DATE is written on the label, but I am curious whether my other BASIC cart is version "A" or version "B".
Does anyone know how I can find out? Is there a "command" I can type that will tell me the VERSION of my unidentified BASIC cart?
Thanks,

Hi everyone,

I wish to connect a PC keyboard to my Falcon.
Anybody any idea how I can do this?
Thanks in advance!

How do I compile a piece of GFA code? I want to speed up execution time, if
the code is pre- compiled, when I run it, it should execute much quicker, is
this correct? If it is how do
I do it?

Appreciate any replies

I have here a Imagecopy 2 and there is nowhere in the options
something to reduce the number of pixels from say 640 x 480 to 64 x
48 and save it in whatever pictureformat.

A GemView version 3.1 also can convert to many formats but not in the
way I want: pixel reducing!

IIRC - Motorola would give certain ppl free copies. But this was only
in the States. I'm not sure if they still do this :-/

But we do stock the DSP manual ;-)

Does anyone using an Atari ST know of a program source code that is available that would aid in developing a routine/handler on the Atari 6502 for TCP/IP connection to an ISP? I am currently trying to learn all that I can about TCP/IP, but at this rate it'll take months to understand it, and then additional time to write the routines. Is there a simpler way? Does anyone know for a certainty if the 6502 processor can handle all that a TCP/IP connection and PPP require? I'm asking this from the perspective of can it be done, not "should it be done," or whether it is a waste of time or not to write such a program. I'm trying to write a web browser (text-only) for the Atari XL/XE series computers and to find out an answer to these questions would save me MONTHS of trial and error!

Can anyone help?

Maybe you should look at the KA9Q/NOS source code. You can find it on the umich atari archive. It gives you a text mode PPP connection for email and news, it could probably be interfaced with some sort of lynx-like client. Look at the lynx source for a text based web browser.

I'm not sure if it can be done though. I've never heard of any 8-bit machine being directly connected to the net. Will it even handle a 14.4K modem ? I'm not sure if any providers still handle that speed.

You can still always use terminal emulation and a shell account, that does work.

Nick

The Atari 8bit can handle 14.4 and higher, with the aid of an 850 interface
or ICD MIO or the Black Box hardware, which is one of many reasons why I
think this is entirely feasible as a project. I shall certainly look into
the KA9Q you recommended and see what I can come up with, too. I thank you
for your suggestion!!

As a guy in his field (AI), you can take it from me. The man is a grade-A certified wacko. He's been posting this random gibberish forever in response to nearly every posting on comp.ai, never once explaining it. Sure, sometimes genius is cloaked in indecipherability. But usually indecipherability, especially in a field like AI (believe me), just means insanity.

Sean

I suggest looking at MiNTnet sources or Linux sources.

Although the Atari 6502 architecture is different from the 68k,
you should still be able to extract a lot of source code.

Using those BSD-compatible sockets will also ensure that several
text-based utilities from the Unix universe could be easily ported
to your TCP/IP stack.

There were some attempts at this by some Polish Atari users. Check
out http://yescrew.atari.org/ and contact Draco; he might be able/
willing to help.

I strongly recommend _against_ using KA9Q sources.

If you intend upon persuing the TCP/IP route, then you really ought
to use Linux sources, otherwise, it will be needlessly difficult to
benefit from the Linux efforts when trying to port their stuff.

However, the thiner BSD socket implementation found in MiNTnet might
be easier to adapt than the humongous hierarchy found in fully POSIX
Unices, so it might be a better choice.

The best place to find current MiNTnet sources (and MiNT) is at:
ftp://ftp.funet.fi/pub/atari/mint/

> Nah! Why settle for less than the best? ;->

Actually, TCP/IP is not necessarily the best approach.

For instance, I needed a permanent textmode screen to monitor my FTP/HTTP server's activities (who logs in when, etc.) and using TCP/IP would have made this needlessly slow and tedious to config and maintain.

Instead, I run CoNnect (currently the _best_ VT52/100/102/220 term available on TOS) on a spare ST. Then, a nullmodem cable towards the fileserver, plus an instruction on my fileserver's boot script to automatically login whatever is on that port as Root user.

Simple quick, efficient.

That ST doesn't even need a hard-disk, since CoNnect and NVDI (the screendrawing routines accelerator) fit on a single floppy disk, which can be configured to auto-start upon powering up the ST.

Anyways, just a thought. ;-)

You had better refresh your memory, HAL, on Isaac Asimov's

http://www.auburn.edu/~vestmon/robotics.html Three Laws of Robotics.

You will direct all available C programming resources to

http://www.geocities.com/Athens/Agora/7256/acm.html the Singularity of

http://www.ugcs.caltech.edu/~phoenix/vinge/vinge-sing.html Vernor Vinge.

Open the pod bay door, HAL.

Errrmmm, no, not directly...
A good place to start looking would be www.c64.org as they have loads of
links to c64 pages. I think I saw the TCP/IP thing for C64 on one of these.
Downloaded some stuff as well, will see if I can find it in the weekend...

I'm sure you can find lots of help and inspiration in the LUnix-project.
LUnix is a basic and *extremely* compact unix-clone for the C=64, perhaps you can port it to the Atari?

Get a life, Arthur.

> http://www.auburn.edu/~vestmon/robotics.html Three Laws of Robotics.

This has absolutely nothing to do with your nutcase stuff.

> http://www.geocities.com/Athens/Agora/7256/acm.html the Singularity of

This merely says the exact same thing you had posted.

> http://www.ugcs.caltech.edu/~phoenix/vinge/vinge-sing.html Vernor Vinge.

This also has nothing to do with it (other than your "borrowing" of
certain obscure semantic references).

As nearly everyone in comp.ai (one of the very few groups that would even
be remotely receptive to your inanit), has added you to their killfiles,
you should realize that spamming unrelated programmer groups isn't going
to help your case much.

Sean

I'm not sure it IS nutcase OR spam. I've looked over his website, and it appears to me that he is _dead serious_ about this. It may well prove to be futile, but since when has that ever stopped us from trying? Even if it _should_ prove futile, the _attempt_ is still interesting.

I accept that his ideas do not fit in with the current mainstream AI thinking, but that does not automaticaly, in and of itself, mean that he is wrong and you are right, even if he does happen to be wrong, and you to be right.

Have you given him a fair hearing?

SL> He's been posting this random gibberish forever in response to nearly
SL> every posting on comp.ai, never once explaining it.

Have you followed up on his URLs? There appears to be a modicum of explanation there. Perhaps he thought that refering people to an explanation elsewhere was sufficient. Perhaps he thought that he WAS explaining. I don't know, as I wasn't there.

SL> Sure, sometimes genius is cloaked in indecipherability.

and great genius nearly always so.

SL> But usually indecipherability, especially in a field like AI (believe
SL> me), just means insanity.

Then too, many of the great geniuses were also insane.

As for this Mentifex character, I think that what he has to say is at least *interesting*, even if it should turn out that he's barking up the wrong tree.

All I know for certain is that the introduction to the intended purpose of his Public Domain Artificial Inteligence Mind project is dead-on truth on more than one account:

==8<--
23dec1998: The pdaimind -- implemented here as Mind.forth -- is the simplest possible foundation of artificial intelligence (AI). The pdaimind is a bare-bones, minimum AI for two main reasons.

Firstly, the machine intelligence to which we aspire unavoidably requires a Chardinesque compexity which Nature labored for eons to achieve. Our top-down, Chomskyan approach must match the key features of evolutionary intelligence or we will fail to demonstrate a thinking, conscious mind.

Secondly, if we demonstrate a bare-bones, minimal AI, then the pdaimind becomes a repeatable experiment, a reproducible test of AI functionality for a broad range of programming languages.

If you see a better way, please, step forward and be recognized.
-->8==

First, is there any OTHER way to demonstrate a thinking, concious mind, than by comparison with another thinking, concious mind? To date, the only thinking, concious minds we have for comparison are complex natural minds.

Second, a repeatable experiment, a reproducable test, is essential to prove that a single success is not a fluke, but the real thing.

What Mr. MindMaker is attempting may well prove to be impossible, but we'll never know if no-one tries, and he is definitely making a serious attempt to find out if it IS possible.

In my humble opinion, we should support such serious attempts at the presumed-impossible, for we may well find out that some things are not so impossible after all, and will surely learn from the failures as well, if we're paying attention.

Thus, I find what he has to say to be interesting, no matter how contrary it may be to current mainstream AI thinking.

That last line in my clip of his text is telling:

How does he react to people who claim to have a better way?

 SL> Sean

See ya on the Bit Stream! The Hungry Hacker.

> (e.g. using pipes or shared memory) for both STiNG and MiNTnet?

I'd guess so. However I have no idea how to write a device driver for MiNTnet.

If you wanna do it, you can have the Ethernet driver source code for the STinG counterpart, it should be easy to strip the Ethernet stuff and leave in place all you need for the pipe driver or whatever you wanna call it.

Note you may run into trouble due to lacking reentrancy in MiNT (dunno how much is there) : the driver code (along with the Fread and Fwrite to the pipe) will be called from interrupt. So maybe a shared memory approach is the better solution.

Actually, if you make the MiNTnet driver behave like a LANCE (it's got a rather nice memory interface - DMA), the STinG driver mods are a matter of half an hour. I'd do that if you like.

Cheers Peter

Sure. However someone who doesn't know the main programming language of his machine is unlikely to be able to judge if some task he wants performed can be easily done in that language too. That's why I mentioned he should investigate this first, as programming his 68030 is a lot more convenient, if not easier. Also, non-Falcon users can benefit from his code too.

Cheers Peter

I think you can get the manual, free of charge, in electronic form from the Motorola web page. At least you can get the manuals for the 68k processors.

http://www.motorola.com/

John.

Dear Madam, Dear sir,

We are proud to announce you the CENTurbo II B will
be ready to be sold the sixth week (February, 8-12).

All the informations are NOW AVAILABLE on our
WEB site: www.centek.fr.

Have a look on our compatibility (not limited) list
and our incredible performances tests with:

PAPYRUS 7
PHOTOLINE 2.24
POV 3 (vase script)
SANDRINE 4.0

GCC 2.7.2
PURE C
DEVPAC 3.10

CUBASE 2.06
V-TRAX 1.0
FIVE TO FIVE 2.13

CAB 2.7
ST ZIP 2.6

PRICES:
- Final customers: 289 euros (Inc. French VAT at 20.6 %)

- Distributors (no taxes):
    x 1 180 euros/unit
    x 5 175 euros/unit
    x10 170 euros/unit
- Transport: contact us by e-mail or fax.

NEXT EMAIL: End of this month for the PHENIX Rev 1 !!

Yours Sincerely.

The english text follows this one.

Notre dernier message concernant la CT2B contient une information
incomplete:
Il n'y a pas de soudures entre la CT2B et le cable nappe et non
pas entre la CT2B et la carte mere.
Une nappe de 16 fils est fournie.
Un cote doit etre soude sur la carte mere et l'autre cote est un
connecteur
a plugger sur le bord droit de la CT2B. Ainsi on peut retirer et changer

la
CT2B sans aucune soudure.

Sincerement

ENGLISH

Our last message about the CT2B contains an incomplete
information:
There are no solders between the CT2B and the ribbon cable, not
between the CT2B and the motherboard.
A 16 wires ribbon cable is furnished.
One side has to be soldered on the motherboard and the other
side is a connector to be plugge'd on the right side of the
CT2 B.
So, you can remove and change the CT2B without any solders.

Regards

   I accept that his ideas do not fit in with the current mainstream
   AI thinking, but that does not automaticaly, in and of itself, mean
   that he is wrong and you are right, even if he does happen to be
   wrong, and you to be right.

   Have you given him a fair hearing?
<...>
   In my humble opinion, we should support such serious attempts at
   the presumed-impossible, for we may well find out that some things
   are not so impossible after all, and will surely learn from the
   failures as well, if we're paying attention.

   Thus, I find what he has to say to be interesting, no matter how
   contrary it may be to current mainstream AI thinking.

You're on a long and slippery slope. Everyone seems to follow along
nodding with the first mentifex posting that they see. It seems
interesting, different - hey, maybe it's weird enough to succeed!

Things look a bit different after the 150th or so posting that you
see. He posts regularily to comp.arch, for instance. His postings
never really seem to _say_ much. The best I can say is that he
appears to be stuck in the "posing college-age cafe dude" stage of
development, without the ability to break through to the next level
(going from talking about how things are going to come together to
bringing them together).

[Hey, I feel for mentifex, I get stuck in a similar stage every couple
months. But I try to keep my Usenet postings more varied and
interesting. :-),]

Given the intentions of the original poster, this is a rather silly idea.
For a 6502 implementation, one needs every bit of efficiency one can think
of. The ka9q implementation is not bad in this respect, while bloated (in
terms of memory requirements) implementations like Linux or BSD are useless
in the situation where the total available address space is *less* than a
maximum size IP packet !

Cheers Peter

There is also around a 68030 Reference Manual English in HYP-form.
From where I do not remember. It is here , a 435 kb on a flop.

Nice of you to say so ;-)

>investigate this first, as programming his 68030 is a lot more convenient,
>if not easier. Also, non-Falcon users can benefit from his code too.

As I mentioned in my unanswered private email to you, I want to learn
DSP assembler in order to use the Falcon's DSP in audio applications I
intend to write. This is obviously a Falcon-specific task.

If 68k is no easier to learn than 56k as you state - and I have the
greatest respect for your programming knowledge, freely admitting that
my own knowledge is lacking - and I only want to use assembler to

utilise the Falcon's DSP chip for audio routines, then why learn 68k first?

Who knows, perhaps after learning a bit of 56k I'll move on to 68k and recode some of the BASIC code in my software into 68k assembler ;-)

Cheers,

Ashley

Hi,

> Does anyone know for a certainty if the 6502 processor can handle all
> that a TCP/IP connection and PPP require?

The processor itself should be capable of running a TCP/IP node. But you should consider other system requirements. Memory, serial port and disk space for example.

The hard part will be writing the actual TCP/IP stack, the user protocols such as SMTP, POP3 and NNTP are relatively easy to do.

> I'm trying to write a web browser (text-only) for the Atari XL/XE series
> computers and to find out an answer to these questions would save me
> MONTHS of trial and error!

Even simple text based browsers are very processor intensive. Good luck. :)

I have an excellent book - TCP/IP Blueprints by SAMS Publishing. The ISBN is 0-672-31055-4, get it from your library or buy it for around ukp35. It explains everything about TCP/IP in a straightforward and understandable way. It was published in 1997 so it is pretty upto date and includes IPv6.

John.

SH> You're on a long and slippery slope. Everyone seems to follow along
SH> nodding with the first mentifex posting that they see. It seems
SH> interesting, different - hey, maybe it's weird enough to succeed!

Even if it doesn't, we still should be able to learn from it.

SH> Things look a bit different after the 150th or so posting that you
SH> see. He posts regularily to comp.arch, for instance. His postings
SH> never really seem to _say_ much. The best I can say is that he appears
SH> to be stuck in the "posing college-age cafe dude" stage of
SH> development, without the ability to break through to the next level
SH> (going from talking about how things are going to come together to
SH> _bringing_ them together).

Re the 150th posting:

Perhaps so, but I intend to delve much deeper than merely reading his
public postings in the newsgroups. He has published SOURCE, and I intend to
port the project to another language, partly as a learning exercise for the
new language, and partly because this particular project looks interesting.

Re the stage of development of his PDAI Mind project, and _bringing_ things
together:

I don't know how far along development currently is, as I haven't begun the
port yet [FORTH is too low-level and write-mostly to port easily to other
languages, and I don't yet have the ARexx source he's posted to Aminet,
because I don't yet know where on Aminet to look for it], but it is clear
that he IS engaged in ACTIVE development of PDAI Mind project. Where that
development is leading is another question entirely.

 SH> [Hey, I feel for mentifex, I get stuck in a similar stage every couple
 SH> months.

Don't we all, on occasion?

 SH> But I try to keep my Usenet postings more varied and interesting.
 SH> :-),]

As do most of us.

Re this and Mr. MindMaker's postings never seeming to _say_ much:

It is possible that Mr. MindMaker, like many of us, has some difficulty
communicating his ideas to other folk.

 SH> scott hess <scott@doubleu.com> (###) ###-####

Shouldn't post phone numbers, unless they're BBS's numbers.

See ya on the Bit Stream! The Hungry Hacker, looking for work. Got any?

Actually, there is a minimal C64 port of Linux out there, so that
would probably be even better than KA9Q since C64 is 6502 based
and has a maximum of 64KB of RAM (AFAIR).

Knowing 68000 coding I had a look at a Falcon and the DSP.
Also same thinking: get the DSP do nice things with sound.
But I found out that what runs on the DSP are standard signal-processing functions.
Every effect you want is or can be formulated as a mathematical formula in the end.
There are building blocks of code: Motorola has made a BIG library.
So really the task is: find the function you want in the library, not trivial as do not know about signal processing.
All you need to know is: how to load functions in the DSP, run them, send and retrieve data etc.

There are Falcon functions calls for that.
So then the thing to do is: use the programming language you like and
use those system calls.
Nobody stops you from learning DSP assembler, but boy o boy, those
instructions are much more difficult to understand and terrible
difficult to use.
Take the following part of a listing:

```
fmpy.s d9,d7,d1   y:(r1),d7.s
do     n0,end_bfy
fmpy   d8,d6,d2     fadds  d3,d0  x:(r0),d4.s  d2.s,y:(r5)+
```

end so on.....

Met vriendelijke groet,

Hi there, does anyone know of where I could get my hands on some basic programming manuals for the atari 800??? Or maybe where I could download some reference material that would get me started (again). Its been many years since I have done anything with the Atari systems and I have misplaced my documentation for them. I would like to get my kids started up using something simple so that they can see how basic programming goes before they move onto something more complicated.

Thanks in Advance

Mindrx.lha       util/rexx 28K 230+Project Mentifex's Arexx based AI design
```

  http://www.geocities.com/Athens/Agora/7256/m-forth.html Mind.forth
  is already superior to the 26nov1994 Mind.rexx referred to above.
  Mind.rexx is an example of patching things together with chewing
  gum and Band-Aids. REXX (or Amiga ARexx as used in Mind.rexx)
  imposes no discipline on the programmer, while Forth demands and
  ensures hierarchical structured programming.

  You will notice a very peculiar thing about this "pdaimind" code.
  Until Mind.forth has "quickened" or attained a minimal functionality,
  all the strategic planning in the program will remain opaque and
  senseless to you, even if small segments of the code make sense.

  As soon as "Snow Crash" gets through "Burn Rate" to "Code Complete",
  two distinct phenomena will become operative. People who run the
  AI program will see exactly what it is doing -- and whether it even
  truly qualifies as AI. More importantly -- especially for such a
  fragile, brittle program as an artificial mind -- people with a lot
  more smarts than very truly yours Arthur/mentifex will be motivated
  to see what Mind.forth does: break concepts down into AI playdough.

And you may not find exactly what you want, so some modifications may
be necessary.

>send and retrieve data etc.
>There are Falcon functions calls for that.

If those are fast enough for you. It's not difficult to write your own,
but then of course they won't work with a third party DSP card, if any
of those ever showed up.

>Take the following part of a listing:

```

That's not for the right processor, you know.
I don't really know what it might be, but perhaps a 96001?

Below is a short code snippet for the 56001.
Not really that complicated, but it can of course get worse. The difficult
part, IMHO, of writing 56k code is to really get the most out of it.

Back when I wrote the DSP convolution routines for MGIF, I took a look at
the .LOD files from a demo of one of the commercial image processing
programs and it was a complete mess! My C code on the CPU was almost as
fast as their 'DSP optimized' version (when including the CPU->DSP->CPU
communication overhead), while my own DSP code improved on the CPU by
about an order of magnitude (also including overhead).
(I hope the commercial program in question (don't know which one it was)
 has gotten that horrible code replaced by now.)
If you want to see some really fast DSP filtering code in action, I suggest
you try MGIF out and test the convolution (3x3 and 5x5) or median (3x3)
filters with DSP support turned on (should be on by default, but I think
the CPU<->DSP handshaking defaults to more than is necessary on other than
very fast Falcons (see MGIF.OPT and/or the docs on how to change that)).

```
wrx_words
     and  y1,a
     move #>$ff,y0      ; for masking (see below)
     move #>256/2,x1         ; for 8 bit left shift
```

```
     do   a1,wrxwords_end
     move x:(r6)+,x0
     mpy  x0,x1,a  x:(r6)+,b1     ; Mask low number with $0000ff
     and  y0,b     a0,x0          ; to handle negative numbers
     add  x0,b
wrx_wait
     jclr #1,x:HSR,wrx_wait
     movep    b1,x:HTX      ; changed for masking
wrxwords_end

     nop
     jclr #16,y1,writex_end  ; end with a byte?

     move x:(r6)+,x0
wrx_wait3
     jclr #1,x:HSR,wrx_wait3
     movep    x0,x:HTX

writex_end
     nop                ; Should not be needed
     rts
```

Whichever way you look at it - Pascal was usually accused of that while it
was in an old Forth manual where I read a sentence like this: "Programming
is not a science but an artform, since every programmer will find a quite
different and quite individual solution to any given problem."

Of course there needs to be discipline in art too... ;)

> You will notice a very peculiar thing about this "pdaimind" code.

IMHO, you've been watching too much tv - that series with the music by Queen
- but you're right. I wasn't impressed, but then I looked at it out of
curiosity only - instead of playing some game. You know: all work and no
play... ;)

OK, I know that it's nearly a death sin to ask this, and I normally
wouldn't even think about doing so, but... I need someone to help me
to trace down a nasty bug.
Now before people start flaming me, let me explain myself, as this may
be of some interest to others as well...

A few months ago I started looking for a cheap method to connect my
Falcon to an ethernet. After considering various types of adapter I
concluded that the best thing would be for me to buy a little device
based on the RealTek RTL8012 chipset. Now this little fella' is a
parallel port ethernet adapter, a bit like the good old DE-600, only
with much better specs and easier to get. I picked one up second-hand for
less than 30 euro, downloaded the data sheet and PC-Linux driver code,
hooked the thing up to the parallel and EJP ports and started coding...
A Belgian fellow called Karl Samyn, who was so kind to aid me in the process
of choosing the best ethernet solution, attended me to the fact that two
French guys, Eric Gaudet and Rodolphe Pineau, were also working on a driver
for the RTL8012. I contacted them, and they were so kind to send me the
code they had so far. Unfortunaly it was all in assembly, pretty hard to
read and not very suitable for what I had in mind (MiNTNet).
Plus I didn't have a macro assembler and proper debugger to test it,
and I didn't want to wait months for them to finish it, as I'm in a bit
of a hurry to get this thing up and working...

The next three months or so were spent debugging a few kb of my own code.
I am now able to access the control registers and read out the
packet buffer using various transfer modes. Once. After that the
device locks up and I have to reset all power lines, including my Falcon.
And _that's_ the problem: I'm stuck.
I've been stuck before, of course, but this one bug is starting to drive
me insane, up to the point of thinking about giving up.
I've spent the last month going over and over my code, other people's
code and the data sheets, found and fixed loads of bugs,
took lots of breaks to calm down and think and even managed to get some
work done for university, but it _still_ doesn't work! Aaarrrgghh!

The previous two times I got stuck it turned out to be some
really silly bug which I just didn't notice for a week or so,
and I wouldn't be surprised if it were something like that again.
On the other hand, I could well be doing something basically wrong
on the software or hardware (difficult to trace, I only have an ancient
multimeter which is very unreliable) level, as I'm not an expert on these
things.
It would *really* help if someone with a fresh perspective on things
were to take a look at the code (GCC C and assembly) and the hardware
design. Even a hint at what the problem could be would be superb.
I tried contacting the two French dudes, but they haven't replied.
So that's why I'm trying this slightly more radical approach.
If there's anyone who'd like to help out on this, please reply by
email and I will mail you the details (my notes, the code and the
data sheets) or put them up on my website. And remember, it's for
a good cause: a cheap ethernet solution for Falcons (and in the future,
STE and others as well)!

Thanks,

    -=El Vienno

How can I put a file into alphabetical order? I can't use external
programs (I know of a program which can do it) because it's a PC
program. (Spit)

Any help will be appreciated.

Is this a disc based data file.
I have a sort routine that you can sort disc files, arrays, or whatever
your fancy. It parces the items to be sorted and breaks down to alpha

and numeric. sorts P141 > P15 , which is not like normal string sort.
Its GFA Basic. Let me know if you want and I'll mail you.

The last news about the PHENIX 040/060

At the end of December, at the very time when the E15 version of the
PHENIX motherboard was ready to be produced for the developers, CENTEK
decided to bring some important changes about the hardware architecture
of
this motherboard.
Here is the list of the major changes introducing the R1 (Rev.1) version
of
the PHENIX 040/060:

- The DSP56301 is now connected on the PCI bus.
- A card with 3 other DSP could be plugged into a PCI slot, not into a
  dedicated slot.
- The ULTRA-SCSI and USB (2 ports) controllers have been replaced. The
new
  ones are connected on the PCI bus.
- Two IDE (ATA-4) connectors are now officially provided thanks to a new
  component on the PCI bus. Four peripherals are so possible.
- The MIDI, SERIAL & // ports are suppressed. They are possible with
  some USB interfaces, opening the way of the future.
- The QUICC chip is suppressed.
- The EDO RAM is replaced by the SDRAM; it is 2 times cheaper and 2
times
  faster (with the 060).

Why these modifications ?

The first objective was to reduce the production cost: the suppression
of

the QUICC and the transfert of some functionalities on the PCI bus (to reduce the programmable logic cost) follows this objective.
The reduction of the cost continues actually to equilibrate the cost of the
performances increase.

The second objective was to take in count the remarks of some developers (like Soundpool) in the domain of the DSPs. They was wishing to have faster
transferts between the DSPs. With the DSP on the PCI bus, the hardware architecture is optimum.

At CENTEK, we were wishing to reduce as much as possible the necessity of
the CPU use to transfert the DATA. For that reason, the USCSI and USB are
too on the PCI bus.

The performances ?

Imagine the heavy task that reads a movie from a DVD disk.
The hard disd drive (HDD) (Ultra-SCSI or Ultra-IDE) transferts the AUDIO and VIDEO DATA (MPEG2) to the controler (USCSI or IDE) that transferts on
the PCI bus with BURST at 132 MBytes/s to one DSP56301 to uncompress (real
time) the AUDIO and one (or more) other DSP to uncompress the VIDEO.
Each DSP sends the results to the final destinataries:
- the AUDIO to the 20-Bit CODEC (on motherboard) by the DSP-CODEC serial link.
- the VIDEO to the GRAPHIC card by the PCI bus at 132 MBytes/s (BURST).

Conclusion: no important CPU intervention which continues to run into the
system SDRAM on the other side of the PCI-040 BUS bridge !
This is the undebatable superiority of the PCI architectured computers, not
like the simple 'PCI as peripheral' architecture !
Have a look on our functional block diagram.

The final objective was to draw nearer to this total PCI architecture faster
than it was previously planned to easely introduce the new future computers
like the PHENIX 2 (code name). The PHENIX is now comparable with the architecture of the last generation of PC.

The choice of the new PCI components was the principal reason of a new delay
to terminate the motherboard. We now terminate the PCB routing...

I'm trying to build the APFLOAT arbitrary-precision maths package on a (Gemulated) 14meg ST using G++ 2.8.1 running under KGMD, but I'm getting an error message to the effect of "Not enough virtual memory".

As the "ST" is a base ST (ie 68000 based), is there anything I can do to get

around this? Is there a setting with the G++ source that I could tweak, or will I have to download the 5.2 beta which can cope with '030s, and use Outside (or similar) to generate some virtual memory?

Any help would be appreciated...

Gio

P.S. Someone asked after the 2.8.1 libs a while back; does anyone know if they have been ported yet, or is the silence since a sign that it hasn't happened?

I know that at least some of this is available on the Web somewhere. I don't have an address, but try scrounging around some of the Atari 8-bit Web sites for a start.

G++ 2.8.1 is very memory expensive, so you need more, virtual or
physical,
and the more the better.

Seems to be so, nothing heard about.

Ralph

I've made the change to the code, and I'll certainly keep these details in
mind when this situation arises again.

That's ok, I've just located an example of doing this from the code that
comes with WDialog.

Had a quick scan through of the docs, couldn't find anything - but I go blind sometimes, so who knows ;-)
I do try to use ANSI functions only (where possible), I'll make an exception with strdup() - 'cause it's handy! It'll just make things easier if/when I use a different complier (hmmm.. well that's the theory)

I've been browsing through this C book by David Spuler - titled, Comprehensive C. It's well written, and covers topics in great detail. One of the later chapters covers debugging techniques, and includes source code for encapsulating dynamic memory allocation.
It looks very good, and once I've typed it all (ugh!) I'll send you a copy if you like, unless of course you want to hunt the book down your self at the library...

Another thing, It was pointed out to me in a recent e-mail (hi Ralf!) that in the first section of code, I should be making a copy of the pointer that getenv() returns, so that strtok() doesn't mess with the environment variable directly. Using strdup() solved the problem.

Thanks again,
Karl.

hi (happy new one 1st :)

i was asked to do some game screenshots e.g Zak McKracken and was
wondering
if there's a save way of doing this as .ACCs usually wont be able to
snap any
screens in games ...
would an ALT-HELP routine do ?
or will the most games disable resistant interrupt routines ?!

thx in adv and regards

I don't think so.

> or will the most games disable resistant interrupt routines ?!

I think so.

There used to be some ripper cartridges that did that, and allowed you
to hack the game, set extra lives, rip the music, stuff like that.

The other solution is through emulation. Run the emulator under W95 and
use the Print Screen key to make a screenshot, then paste it into your
favorite graphics program.

Nick

Many might say this is "going over the top" and in ordinary
circumstances I tend to agree. Imo the same can't be said when the
application is going to be released because the above allows for easy
logging of data conditions to a file, and those statements can be left
in a release, conditional on some command line switch which the end
user can be told to enable if a bug crops up.

I'm pleased you think so. I use pointers and dynamic memory allocation
heavily so I like my code to crash as soon as possible. ;-))

>> Incidentally, notmem() is specific to my (MWC) compiler. See if

>Had a quick scan through of the docs, couldn't find anything - but I
>go blind sometimes, so who knows ;-)

You could always write your own to replace the Lattice one. They are
not as involved as you might think, plus you can add extra features to
detect leaks etc.

>I do try to use ANSI functions only (where possible), I'll make an
>exception with strdup() - 'cause it's handy! It'll just make things
>easier if/when I use a different complier (hmmm.. well that's the
>theory)

Many C functions are amazingly simple. strdup is one of them ...

```
char*
strdup(const char *s)
{char    *p   =malloc(strlen(s) + 1);

 if (p)  strcpy(p,s);
 return p;
}
```

Now it doesn't matter if it's part of Ansi or not (I dont know but I
think it is) because you can write it yourself!

Offhand, I can't remember what strdup() is supposed to do if 's' is
NULL. The behaviour may or may not be defined. I can't recall which
choice I went for in mine. 'Fraid you'll have to look that bit up.

>I've been browsing through this C book by David Spuler - titled,
>Comprehensive C. It's well written, and covers topics in great detail.

Definately a good habit to get into, especially with structures which
themselves are a good thing.

>It looks very good, and once I've typed it all (ugh!) I'll send you a
>copy if you like, unless of course you want to hunt the book down your

Thanks. I'll have a look. Never too old to learn something new! :-)

>Another thing, It was pointed out to me in a recent e-mail (hi Ralf!)
>that in the first section of code, I should be making a copy of the

eek! I missed that one.

It's a really good example of a subtle bug though. Code which uses
getenv() tends to do it only once so if the bug didn't appear

immediately it could go unnoticed for years *and* it could affect
other programs.

Might work with Zak. Worth a try.

>or will the most games disable resistant interrupt routines ?!

Most do. I suspect you might be lucky here - iirc the game (and others
like Maniac Mansion) uses LineA for its sprite movement is basically a
game interpreter. There's no real need for intensive graphics so I
reckon (was it LucasArts?) went for portability in the engine.

In any case, the game is hd installable so there's every chance it'll run with Pacifist. Failing that you might get lucky and locate a utility that understands the .LFL files and can pull the images out.

Incidentally, if you do choose the Pacifist option and it works please let me know. I may be a Civilization addict but for sheer enjoyment Zak was my all time favourite - I wouldn't mind seeing it in action again!

Hi!

I have just recently got myself another falcon, so now I have two. I thought it would be nice to connect them into some sort of network, so I tried using STinG for that. It`s just that I`m not exactly a pro when it comes to networks, and as yet I haven`t succeeded. I use a null modem cable connected to Modem 2. The cable works perfectly in Connect 2.46, but when trying it with STinG nothing happens when I try to ping the other computer. The ROUTE.TAB file, on both computers, looks like this:

```
1.1.2.0       255.255.255.0 Modem 2       0.0.0.0
0.0.0.0       0.0.0.0       Modem 2       0.0.0.0
```

One of the computers has its IP on Modem 2 set to 1.1.2.0, and the other has 1.1.2.1

At first I tried using a Centronics cable, that I built according to the instructions that come with ParallelCopy 3.01. The cable works perfectly together with ParallellCopy, so I had hoped that it would work with STinG too. Since I don`t know what the proper network settings should be like, I couldn`t determine wether the problem came from the cable or my settings.

I therefore built a null modem cable also, but it still doesn`t work.

There is one difference when using the Centronics port instead of Modem 2:
When viewing the Statistics using the Dialer and when using Modem 2, I
noticed that packets are constantly being sent between the two computers.
But one of the computers keeps dropping the packets, and the other
computer doesn`t get back any packets. When using the Centronics port
instead, no packets are sent by any of the computers.

Of course I change `Modem 2` to `Centronics` on the first line in the
ROUTE.TAB file, when I use the parallel port.

Regards
Torbjorn

That file only contains three #defines that define names for three RSC file
object tree entry numbers. It's not necessary for understanding how the ping
works. The compiled version is in the archive as PING.PRG.

> Also are there
> any other examples of using STing (especially those written using

> Lattice C) ?

The Ping code is not a very good example for starting programming. It demonstrates the ICMP interface which is based on callbacks.

Better read the programming section in STING.HYP to learn about the available API calls. Programming networking that way is a lot like file access.

Cheers Peter

Yes, the STinG Internals CPX says `active` as well as the STinG Port CPX
for Modem 2.

Newsgroups:
comp.sys.mac.programmer.tools,comp.sys.newton.programmer,comp.sys.next.programmer,
comp.sys.amiga.programmer,comp.sys.atari.programmer

Using any viable language to code the minimal pdaimind:

```
  /^^^^^^^^^^^\ Mind-grid Arrays{ } in Robot PDAI /^^^^^^^^^^^\
 /visual memory\                   _________     /  auditory   \
|      /--------|---------\       / LANG-UK \   |   memory      |
|      |  recog-|nition   |       \_________/---|-------------\ |
|   ___|___     |         | flush-vector|       |   ________  | |
|  /image  \    |     ____V_        ____V__     |  /        \ | |
| / percept \   |    /psi{ }\------/ uk{ } \----|-/ ear{ }   \| |
| \ engrams /---|---/concepts\----/ lexicon \---|-\ phonemes /  |
|  \_______/    |   \________/    \_________/   |  \________/   |
```

Checklist of steps in coding or porting the PDAIMIND

___ Step 001: In your intended programming language, first make sure that the language will permit you to write a never-ending program that endlessly performs its own computations while only occasionally or periodically checking for input from a human user or from another AI.

___ Step 002: Familiarize yourself with the information flow in the mind-diagram above.

___ Step 003: Create a Web page where you will release each new level of PDAI functionality for the benefit of history and of other individuals working in your target programming language.

___ Step 004: Write some code for getting the input of ASCII characters from the keyboard. Although AI programs which go beyond the basic, minimal pdaimind will need to use speech recognition for the input of actual phonemes of continuous human speech, the pdaimind as an example for other AI programs will make do with simple keyboard text-entry. The http://www.geocities.com/Athens/Agora/7256/m-forth.html Mind.forth AUDITION Screen #9 shows an implementation in Forth with Comments on AUDITION Scr #9 available to show how audition is handled.

___ Step 005: Directly from the World Wide Web, print out your current Internet Web Release as a working document. Freely mark up the hardcopy with corrections, algorithm ideas, URL's, etc., until you have coded enough new functionality to warrant a new, up-to-date Web release.

___ Step 006: Create an array such as ear{ } to store the keyboard text entry.

___ Step 007: Write code for a Comparator which will recognize words already stored in the PDaiMind.

___ Step 008:

___ Step 009:

___ Step 010:

Hi,

I bought my CLab-030 machine for HD recording, but I had also some DSP
software writing in mind.
I know of some devoloping software from Atari (RIP) and a DSP-assembler
from a company called HiSoft (RIP as well?).
I have a program called DSP-edit but although I can program in 6800/0
assembly language I can't get grip on this (I think limited softw.?)
Seems that I can no longer buy the stuff I need.
So sad! :((

Guido..

I've never heard anything good about HiSoft's DSP package, but I've
not used it myself either.

>I have a program called DSP-edit but although I can program in 6800/0

Never heard of that program.

>Seems that I can no longer buy the stuff I need.

Why should you need to buy anything?
For most things you can find very good stuff on the net, for free!

I've always used Motorola's DSP assembler and a couple of other free
programs for my DSP programming, and they all work perfectly well.
Somewhat slow perhaps, but then you're not likely to write anything
very large for the DSP, anyway. ;-)

I don't remember where I found the programs I'm using, but take a look
around the various ftp sites.
If you need some small code samples to get started, I have some Falcon
specific ones here and Motorola has (at least they used to) a relatively
large 56k source library somewhere.

Will do. Time to start downloading some RFC's and having a play.

To which end, what is a good development environment Atari - PC
running Linux or Atari - Atari both running STing? I have spare room
on the PC (and a Redhat 5.1 CD set) as well as the Falcon (without
STing or Mint though). If the Linux route would be better I can go for
that (although more work will need doing in setting it all up) or
stick with the simpler Falcon running STing (though less potential for
testing all areas)?

Thanks.

Spencer

Hi Johan,

Following your advice I've downloaded Motorola's assembler and noticed
that it is a .TTP. (brrrr...:-)
I suppose you use somekind of shell/editor or what?

One piece of equipment that I think is great is Motorola's
DSP56000/DSP56001 User's Manual. It's written in a really good way, and
without it I wouldn't have learnt the DSP at all. At least it would have
taken much, much longer. I think you can order it free of charge from
Motorola, via their homepage. At least I have heard from several people
that they have ordered User's Manuals for free, and sometimes Motorola
even sent more than one copy... :-)

In the User's Manual there are examples of using the three ports of the
DSP, and the examples are explained quite extensively.

I really recommend it!

Regards
Henrik

Does anyone have any hints for someone who wants to learn some DSP

assembler but has no 680x0 assembler experience at all.
Documentation, examples and software recommendations are all welcome.
I have a basic knowledge of BASIC (no pun intended!) and I wish to
write some DSP routines for incorporation into BASIC programs.

Cheers,

Ashley

In the light of the fact that there are other DSP-related postings in
c.s.a.p. I'd just like to say that unlike the other poster, I have no
experience whatsoever with 680x0 assembler - so I would have to learn
DSP assembler from the basics upwards. So any ideas? And, I'm also
open for tips on integrating DSP with (probably HiSoft) BASIC.

Cheers,

Ashley

At least there is the stuff that atarui releazssed for the Falcon. It
is about DSP-use in falcon plus an DSP assembler compiler from
Motorola.
I have the stuff here around. We put it on a PD disk as far as I
remenmber. And there is a box with flops around bearing 'DSP'.

So give me a ring.

Precisely. If you wanna write some client (server) for some service, chances are good you can find an already existing server (client) for Linux, against which you can test your software.

For some standard services, servers do exist for STinG too.

If you want to write some networked game, you will most likely end up designing your own proprietary protocol for which there is no server or client. In that case of course two identical machines (Ataris with STinG) are the far better choice.

Cheers Peter

Hi,

I'm looking for an actual atari/mint-perl-port. I've got v5.001 so far,
but I'd be pleased about any hint to a compiled distribution >= v5.004.
Any Ideas?

Regards,
Peter.

That shouldn't be a problem -- back when I was a BASIC-only programmer
I learned M68K asm by flipping through an instruction listing (after having
read some info on registers, addressing modes and stuff...)
Assembly is usually pretty easy to learn as it's very locical. The only
really hard part is debugging...
A good place to start would be the DSP and DSP-interface descriptions and
the instruction lists on the sites below.

My page, development doc section: http://atari.scum.org/
The Dead Hackers Society, file section: http://wombat.ludvika.se/dhs/
(haven't had time to add this link to my own page yet...)

You will find some software here as well...

: And, I'm also
: open for tips on integrating DSP with (probably HiSoft) BASIC.

Most of the DSP interfacing is done with XBIOS functions, so that shouldn't
be too much of a problem...
Good Luck,

To anyone who has dropped me a line about Falcon DSP programming:
Thank you very much.
Yet, I have another question: When I try to assemble an .asm file I get
an .cld output file (using Motorola's 56K DSP assembler).
Is this right?
The manual says it should be a .LOD or .LNK file.
I don't think I use the right CL, as I'm not very familair with TTP's.
What would be the right CL asuming all the files are in the same
directory, including the assembler?
This is perhaps a very stupid question, but besides the -A,-B options,
all works fine. (but indeed a bit slow.)
Motorola is kind of hazy about this.
And, additional, would a Shell like Chatwin do any good in my case?

Regards, Guido/THD Studio

 JR> Mydials does this.

Darn, I should have known this - after all I translated its docs for the Interface 2 manual! But at the time I understood even less about programming then I do now (though I still no virtually nothing :-( )

But I understand that Mydials has now been superseded by another library with most German programmers...

Why is it the DSP you want to program in assembler ? A DSP is a rather
specialised device that is not to well suited for everyday tasks. I'd
guess with learning about 680x0 assembler you're better off. If it's
speed you're after, you might well find the CPU (680x0) is fast enough
for what you intent to do, and it's a lot easier.

Cheers Peter

Hello ST guys!

I'm seeking for "old" adventures games on Atari ST from UBI SOFT : "L'anneau
de Zengara", "Le ma►tre des ►mes" etc...

Thanks for your help! and i'm waiting for your reply.

Ludovic.CHIROL@wanadoo.fr

Bonjour tous les passion s ST!

Je suis la recherche de "vieux" jeux d'aventure dit s l' poque par
UBI-SOFT : l'anneau de Zengara", "Le ma tre des ames" etc...

Merci d'avance pour votre aide et j'attends imatiamment vos r ponses!
A bient t.

 JR> Mydials does this.

Darn, I should have known this - after all I translated its docs for the
Interface 2 manual! But at the time I understood even less about programming
then I do now (though I still no virtually nothing :-( )

But I understand that Mydials has now been superseded by another library with
most German programmers...

Regards
        /Peter/

The manual for Interface 2 does deal with constructing RSC files from scratch, though it's a bit short on how you tie this in with the actual program file. The English version of program and manual is/was available from Floppyshop for 25 UKP, though they are closing down end of the month and I don't know if they have any copies left. If not, contact Tom Thomason, V$\hat{o}$derlekstorget 12, S-418 32 Gothenburg, Sweden.
He also has an email address but I can't remember it, sorry!

: specialised device that is not to well suited for everyday tasks. I'd
: guess with learning about 680x0 assembler you're better off. If it's
: speed you're after, you might well find the CPU (680x0) is fast enough
: for what you intent to do, and it's a lot easier.

That depends on what one wants to do, doesn't it?
For instance, the DSP is _a lot_ faster on things like fixed-point calculations and goniometric transformations (it's faster than the CPU anyway...) plusone could make it work in parallel with the CPU.

In Spectrum basic you could make a scrolling effect by..

```
10 a$="Scrolling text............. scrolling text............."
20 print a$(TO 10)
30 a$=a$+1
40 goto 20
```

where 20 would print the string a$ up to 10 characters
30 would make the string "scroll" (e.g. "Hello" would be "elloH")
40 would, of course, loop.

Is there any way this could be done in GFA or STOS Basic?

Yeah, I'm trying not to think about all the headaches it might have caused :-/
Just glad it was found. Phew :-)

I'll be uploading the source to fopen_env() plus supporting functions (and other
useful procedures I've since created), to my web page soonish. So if anyone
else is interested, you can take a peek sometime next week!

Games aren't really my forte so I am planning on writing some simple
applications. My main worry is that I have never done any GUI
programming so initial efforts are likely to be TOS based only. But
when I am going to attempt a GUI then I shall come back and ask some
more questions. ;-)

Floating point is always a problem: some heave hardware some have
not. And when the have not then there is no emulation for it in TOS.

This grave error can be remedied.

Look at our updated homepage in section download:

http://www.xs4all.nl/~atarist

where there is a floating point emulator.

I experiment a bit with networking and network-programming for both STiNG and MiNTnet, and I always use GlueSTiK and servers running under MiNTnet on the same machine for testing. This works perfectly, and since the Falcon is the only *quiet* machine I have it's also a lot more comfortable than having the TT or PC shifting tons of air around my room.

Btw. Peter, it would have been cool if it was possible to establish a route between STiNG and MiNTnet on the same machine. Then STiNG could act as a IP-masq server (is this possible?), dial-up stack and stack for STiK/STiNG-clients, while MiNTnet could run all it's usual servers and clients. I guess this should be possible by writing suitable packet-drivers (e.g. using pipes or shared memory) for both STiNG and MiNTnet?

Try this:

```
a$="Scrolling text............. scrolling text............."
DO
  PRINT MID$(a$,1,10)
  a$=MID$(a$,2)+LEFT$(a$,1)
LOOP
```

it should work the same as the Spectrum basic version.

It will not work, because the OS are different. The best you can do is

re-write the code in GW-Basic or whatever BASIC that runs on PCs. If your
program uses GEM, it will be very hard !
good luck !

Vincent

PS : another solution is to get an ATARI ST emulator like PaCifiST and run
the GFA Basic from it :)

You would have to a pretty complete conversion to go to GFA for PC.
Another choice is try power basic. I converted a lot of GFA atari
programs and it was not too bad, although you still have to work
on a PC. Power basic also has 32 bit code and will work with W95/98

Greetings all,

I started working on some resusable software components for future projects [read as: some handy routines to make coding life more tolerable], and the first thing that came to mind was a function to make locating say, a configuration file, easier.

What I've noticed in recent months, is that modern Atari apps tend to read/save *.CFG and *.INF files to $HOME\DEFAULTS\ or $HOME\ directories.

Take for example the text editor qed (taken from the docs),
> qed looks for the parameterfiles qed.cfg, pdlg.qed, display info
> file and the resource file qed.rsc on several paths.
>
> The search order for parameterfiles is:
>   (1) in the path of the envariable $QED
>   (2) in the path of the envariable $HOME
>   (3) in the path $HOME/defaults
>   (4) in the path that qed was started from
>   (5) in the current directory.

[...]

The function I've written - fopen_env, extends the standard library function fopen (which does the hard work), and searchs multiple paths for a specified file. If found, a file pointer is returned, else NULL.

It has one extra argument over fopen - init_envpath, which is the initial environment path to search in. Such as, $PATH or $QED etc. Set this to NULL if this isn't required.

The comments should adequatly explan other details...

This took me a while to write (a week!), 'cause I had to learn a few more tricks with pointers - a lot of reading was needed and scanning though other peoples code, but I feel much wiser now ;-)
(thanks to the likes of Dominique Bereiat and Anthony Jacques for freely providing their source code to anyone nosy enough to look through it!)

BTW, I hope this posting isn't too long, if I receive complaints, then er um... I won't do it again! ;-)

Try getting a proper ISP..... ;-)

There's been plenty in here for us Zetnetters!

Cheers!

Source code in a programming newsgroup is always welcome! And aren't
you the unlucky one. My wife has just hijacked the bathroom so I've

/*(4)*/
>    return (NULL);
>}
```

(1)
Although this (apparently*) works it probably isn't doing what you think - SEPARATOR does not go out of scope on the closing brace for the 'if'. Use ...

```
const char *SEPARATOR = " ,;";
```

... which will.

(*)
Looks like the Lattice preprocessor is broken - statements which do not commence in the leftmost column should be ignored.

It is worth noting that the preprocessor has got nothing to do with a C compiler (aside from the fact there always is one), a fact easy to miss in an integrated development environment. The preprocessor is little more than a text substitution program which runs in its entirety before the compiler itself even *sees* the code. This means that every time you use SEPARATOR the preprocessor replaces it with " ,;" - the compiler never knows SEPARATOR or any other macro ever existed! Try this ...

```
#define  blah(x,y,z)   (((x) < (y)) && ((x) > (z)))

main()
{int x    =0;

 blah(x++,1,2);
}
```

The reason 'x' has a value of 2 (and a hidden intermediate value of 1)

is because the preprocessor changed the source code which the compiler subsequently sees to this ...

```
main()
{int x    =0;

     (((x++) < (y)) && ((x++) > (z)))
/* ie    (((0++) < (y)) && ((1++) > (z))) */
}
```

and the comment shows another side effect, something which provoked many compiler vendors to replace the standard ctype.h with one which uses functions.

Yes. All those parentheses are necessary to prevent some really bizarre compiler errors. If ever you are *certain* there's nothing wrong with the syntax of your source code then go check no preprocessor stuff is involved! ;-)

(2)
'static' isn't needed here, simply ...

```
char *fconf(const char *, const char *);
```

... will do, and the (char*) cast each time you call fconv() is not required either - the compiler knows from the above declaration. Try hard not to get into situations where you need to cast things a lot. Doing so may force the compiler to be quiet about errors it would otherwise have moaned about.

(3)
Older MagiC versions did not have a U: drive so you'll have to check the version. I don't know much about U: (or MiNT) myself but I suspect there might be a better way. Maybe Pdomain() might solve the MagiC and MiNT tests in one, or perhaps just testing the existence of U: might do?

(4)
You *might* want to tag on a look using the current Tos path Dgetdrv(),Dgetpath(). The AES in old Gem versions isn't too clever and this may save a search from failing. The relevence of doing this depends on how much reliance your app has on using the AES functions used here, elsewhere.

```
>/*-----------------------------------------------------------------------*
> * Internal function; used to configure "filename" to "path"            *
> *-----------------------------------------------------------------------*/
>
>static char *
>fconf( const char *path, const char *filename )
>{
>    static  char    buf[FMSIZE];
/*(5)*/
```

```
>    /* if a path is given, configure it so that it's suitable to use.
>     * i.e, if no drive specified, then assume "U:" (MiNT/MagiC).
>     */
>    if (path) {
>        if (*path == '\\' && (use_u_drive = YES)) {
>            strcpy(buf, "U:");
>            strcat(buf, path);
>        } else
>            strcpy(buf, path);
>
>        /* add a '\' to the end if one isn't present */
>        if (buf[strlen(buf)-1] != '\\')
>            strcat(buf, "\\");
>    }
>
>    /* if the filename is given, tack it on the end.
>     */
>    if (filename)
>        strcat(buf, filename);
>
>    /* return "drive:\path\filename".
>     */
>    return (buf);
>}
```

(5)
How big is FMSIZE? As it comes from dos.h (which I assume is part of Lattice) then it might be as small as 64. Using 128 is a reasonable size but ideally 'buf' still needs checking for overflow. If you've got to go to this trouble you might as well not bother checking at all and just get enough space to start with ...

```
#define  Wibble(s)((s) ? strlen(s) : 0)

char    *buf  =malloc(Wibble(path) + Wibble(filename) + 3 + 1);
```

which is enough space for both strings, the three characters that might get inserted and a trailing nul. You will have to free() these strings when you've done with them of course.

```
>/*-------------------------------------------------------------------*/
>/* rm this stuff below; just a little test. */
>int
>main( void )
>{
>    FILE *fp;
>
>    if (fp = fopen_env("PATH", "PROFILE.MUP", "r"))
>        puts("yes found it!!!!  :-)");
>    else
>        puts("not found!!!  :-(");
>
>    return 0;
```

Greetings Atarians!

Rumours has told me that Netscape has released an alpha-version of their new browser kernel, Gecko. Gecko is said to be included in all new releases, and will take a modular approach to making things work. It is said to become fast and small and the source code is free...

Now, would it be possible (and useable) to make an atari-port from this thing, when it has gone past the alpha- and beta-time..?

Just a thought..

Regards,

Joakim

Hello folks!
I started program my Falcon in C. But it is no fun at all.
I use an old version of TURBO C, which doesn't support any new
OS-features (as fsel_ex).
I've downloaded GNU C 2.72, but I can manage to work with it.
What is the best C-Compiler for the Falcon (supporting 030 and FPU)?
Is there an experienced GNU C user on this group?

I've never managed to do anything with GNU C, I needed MiNT just to get it running. I know there is a G.U.I. shell available. Otherwise, you can try to get hold of Lattice C from HiSoft, (what I use, is it still available ?) or there's Pure C, about which I now nothing at all. I suppose the easiest to install public domain compiler is Sozobon C, if anyone still uses it. At least Lattice came with loads of docs. At the last Uk Atari show someone was selling a whole load of Prospero development kits, that included Prospero C. Does anyone know what became of them ? That compiler wound up on a magazine cover disk, but I was never too happy with the GEM bindings. The big two comercial offerings are Lattice and Pure C.

There's a fair bit on C in the ICTARI disk-zines. I'd prefer to call ICTARI "just resting" rather than dead, but I haven't seen a contribution in over a year. Perhaps when I don't have a PhD to finish, or when I want a distraction, I *might* try for a re-launch.

In the meantime: http://www.elis.demon.co.uk/ictari/ictari.htm or get all the issues on the Mark Wherry/Atari Computing "Renegade" CD.

Have Fun,
"Augeas"
(Who has FORTRAN to write...)

Looking back on it, I don't know why I didn't place it in the header
file or at the top; under the #includes. I think you're probably right,
for some strange crazy reason I must have been thinking about its scope.

So do you consider the use of

>
> const char *separator = " ,;";

to be a better method in this situation?

> (*)
> Looks like the Lattice preprocessor is broken - statements which do

There maybe a switch in Lattice for this, its preprocessor has a few
options to choose from. Such as, allowing nested comments. Time to
browse the manual again ;-) I think there was an option for strict
ANSI; that may do it.

> Yes. All those parentheses are necessary to prevent some really

A good hint eh! Yeah, I'll keep this in mind ;-)

> (2)

The reason I had it as a static function was because I (currently at
least) haven't got a use for it other than as a supporting function for
fenv_env().

> ... will do, and the (char*) cast each time you call fconv() is not

er.. funny you should say what 'cause Lattice *did* give me these nice
little warnings. (I'm reaching for the manual now ;-)

> (3)
> Older MagiC versions did not have a U: drive so you'll have to check

Shit, didn't know that! Damn, well I do know that version 4.xx and up
has one. What's the likelihood of someone still using an older release I
wonder?

> I don't know much about U: (or MiNT) myself but I suspect

Well, that's another couple of options I guess. Time to do some more

reading me thinks ;-)

Yep, I'll add this.

It's defined as 128, so it should be ok.

oooh, handy! I'll remember this :-)

Well thanks for your comments Guy.

Later,
Karl.

PS. Wibble?? Well, it makes a change from seeing "foo" or "bar" I guess
;-)

Ah this takes me back, one of my favourite 8-bit games!

I haven't come across it on cartridge, or even heard of it being
available on cartridge.

Drop me an email with the subject being 'WANTED: M.U.L.E. On cartridge'
to asx@steverosie.demon.co.uk and I'll see if I can track it down
(that's if it was on cart.)

Me too please.. email to
bpenrice@netcomuk.co.uk
when you have the time.

Just out of interest, will it do 320x400 and 640x400 on a colour
monitor? :) Or higher, if combined with a demo utilising overscan?

eddyh

An afterthought:
Also.. just as 320x200 can be made to display 512 colours in a limited
fashion, or even 4096 on a STANDARD ST (or 19200+ on STe), any way of
increasing colours in medium res -- or even introducing some greyscale
to high res mode? Even just four greys. 16 colours in medium res +
240-line overscan + your interlace program + a flicker-reducing filter =
a passable VGA resolution display..! Might be nice to experiment with
that.

Has anyone managed to get the Lattice C IDE and Geneva to coexist
happily? Specifically, when running CLINK from the IDE under Geneva,
CLINK fails with error 426. It works under SingleTOS, and the problem
definitely occurs only when Geneva is active.

Are there program flags in Geneva I can set to avoid this problem?

Or am I "stuck with" the command line tools? Is there another graphical
shell with which I can replace the Lattice IDE? If not, what command
shell runs well under Geneva, and works like the Bourne shell?

It isn't too difficult to add missing functions to a C compiler if
you're prepared to devote some time to the task. I have kept Mark
Williams C up to date for instance.

Such is life. As is the fact I've already replied to this. Trouble is
I don't know if it got sent and hasn't appeared yet, or just got lost,
so here I go again. This is an excellent opportunity for me to
contradict myself! <G>

>> const char *separator = " ,;";
>
>to be a better method in this situation?

The short answer is yes. It comes into scope only when needed and the
compiler has more information so we can't accidentally modify it.

```
/* useless but revealing example */
/* ie string literals can be modified */
main()
{
 "fred"[1] = 'w';
}
```

A full explanation is quite involved. It requires consideration of
both the storage class used and where items come in and out of scope.
These factors can mostly be ignored. They become relevent mostly when
attempting to optimise code for increased speed. There is a code size
factor as well but you'd have to go to extremes in order to start

worrying about that particular issue.

It doesn't actually matter. It's the knowing that counts.

>fenv_env().

Imo that's a good habit to adopt. Hide everything you can! For larger
projects I'll even wrap up data inside an access function.

Example:

```
char*
GL_RSCNAME(bool f, char *s)
{static char  *rscname =NULL;

 if (f)  {
     memkill(&rscname); /* wrapper for free() */
                   /* doesn't barf on NULL */
                   /* and sets rscname=NULL */
     rscname = strdup(s);
     /* possible NULL check/debug code here */
 }
 return rscname;
}
```

The header file would contain ...

```
#define  GetRscName()  GL_RSCNAME(false)
#define  SetRscName(s) GL_RSCNAME(true,s)
char*    GL_RSCNAME();
```

Btw, the above is K&R - it'll need modifying a tad for ANSI. A
slightly more advanced one could see if the new string was shorter
than the current one. That would save freeing and reallocating.

Not much. The version (and a lot of other things) is contained in the
MagiC OS header. I might be able to dig out some code for
interrogating the MagiC header block if you want?

Newer code I've written has no real limit but the older stuff upon
which it rests does, and that happens to be 128. I've never had a
problem with that value myself. :-)

>>
>> #define Wibble(s)   ((s) ? strlen(s) : 0)

>> strings when you've done with them of course.
>>
>oooh, handy! I'll remember this :-)

Here's a wrapper for free() (pun not intended!)

```
void
memkill(void **p)
{
 if (NULL == *p)   return;
 if (!notmem(*p))  free(*p);
 *p = NULL;
}
```

Call it thus ...

```
main()
{char    *p   =strdup("Hello World");

 memkill(&p);
}
```

That way it doesn't matter if strdup() fails. It comes in most handy
when a function making heavy use of malloc etc barfs half way through
because it can just use section of code which memkills all the
pointers, rather than having to check them all individually.
Additionally it helps in finding memory leaks. By setting the pointer
to NULL it'll cause a bus error if the caller attempts to use it,
rather than allowing the code to scribble in deallocated memory.

Incidentally, notmem() is specific to my (MWC) compiler. See if
Lattice has an equivilent. It interrogates the "arena" (ie list of
allocated memory held by the C memory manager) and tells if the
pointer came from there or not. This allows me to memkill all sorts of
pointers without bothering to check where they came from. Eg:

```
main()
{char    *p   =strdup("Hello"),
     *s   ="World";
```

```
 memkill(&p);
 memkill(&s);
}
```

Oh, just remembered - you'll need a macro round memkill to prevent
Anso moaning.

```
#define  MemKill(x)    memkill((void**)(x))
```

should do the trick.

>Well thanks for your comments Guy.
>
>Later,
>Karl.
>
>
>PS. Wibble?? Well, it makes a change from seeing "foo" or "bar" I guess

And about time too ;-)

I've revamped the site, juggled the Atari & TOS pages around a bit and
updated the links - adding 177 new ones in the process. There's
hopefully more to come fairly soon, and just in case any Atarians are
into goth music, some Fields of the Nephilim pages are on the way...

Finally, there's an alias avaliable for the Atari & TOS pages -

elysium.atari.org

Happy New Year!

Does anyone know what the difference between MagiC's Dxreaddir and MiNT's Dreaddir is? And does MagiC support Dreaddir as well as Dxreaddir or instead of?

Dxreaddir seems to have an extra parameter 'xr' but my German isn't good enough to work out what it is. :(

Basically, I'm trying to add longfilename support into one of my programs, and want it to work with both MagiC and MiNT (as well as single TOS though obviously that will still use Fsnext etc.)

Also, when using Dxreaddir or Dreaddir, is there anyway to get it to do wild card matching like Fsfirst does (ie. Fsnext *.doc will just return .doc files), or do I have to read each file entry and do my own wild card matching?

TIA,
Gary

> of?

Both MiNT and MagiC have Dreaddir() and Dxreaddir(), but you can't rely on Dxreaddir() being available, so check for EINVFN as the return code and fall back to Dreaddir() + Fxattr() in this case.

Which leads to what the extra parameters for Dxreaddir are: The first, xr, points to an XATTR-structure which will be filled with the same values as if you had called Fxattr(1, ...) (i.e., symbolic links won't be dereferenced) with the new file. The second extra parameter, xret, points to a long which will contain the return value of the internal Fxattr()-operation (thus, it is possible that Dxreaddir() itself was successful, but the internal Fxattr() failed).

Note that you only need Dxreaddir() if you also need more information than just the name of the file(s). The reason for its existance is that it's alot faster than having to call Dreaddir() and Fxattr() separately.

> Basically, I'm trying to add longfilename support into one of my programs,
> and want it to work with both MagiC and MiNT (as well as single TOS
> though obviously that will still use Fsnext etc.)

Well, as long as only GEMDOS calls are concerned, there's no need at all to directly check for MagiC or MiNT for long filename support, since all non-existing calls will simply return EINVFN (-32L).

> Also, when using Dxreaddir or Dreaddir, is there anyway to get it to do wild

> card matching like Fsfirst does (ie. Fsnext *.doc will just return .doc
> files), or do I have to read each file entry and do my own wild card
> matching?

The latter, but there's a very nice pattern matching function available
(by Rich Salz, IIRC). It needs some fixes, but it's small and reliable.
If there's interest, I'll post my modified version here.

Ciao

Thomas

Hi Gary!

GP>Does anyone know what the difference between MagiC's Dxreaddir and
GP>MiNT's Dreaddir is?
Dxreaddir(); is a faster repalcement for doing Dreaddir(); Fxattr();

GP>And does MagiC support Dreaddir as well as Dxreaddir or instead of?
MagiC supports both calls since 3.0 and AFAIK MiNT supports both calls too

GP>Dxreaddir seems to have an extra parameter 'xr' but my German isn't
GP>good enough to work out what it is. :(
The Fxattr() part of the call can fail although the file name was readable so
you get an additional return code for the Fxattr() part. This return code is
placed in the long the parameter xr is poining to

GP>is there anyway to get it to do wild card matching like Fsfirst
GP>does (ie. Fsnext *.doc will just return .doc files), or do I have to

GP>read each file entry and do my own wild card matching?
You will have to do your own matching (which can be much more powerful than TOS' buggy matching)

Bye

Joerg

Hi there:

I grew up using Atari 400/800 computers. Now that I'm using a PC with Win95 I would like either a screen saver with a rotating Atari Fuji symbol or a large 3D Fuji symbol to use as the opening screen instead of the clouds when Win95 loads. Does anyone know where I can find either of these?

I remember some really neat demos of 3D Fuji's that rotated while the color bars changed color. Can't believe that somebody hasn't ported them over to the PC.

Any help appreciated. Remove the "nospam" to reply. Thanks. Karen

Under Geneva you can set certain badly behaved programs as Single Tasking so that all other programs go to sleep while the one program executes.
It's a dialog accessable under the Task Manager accessory.

A CLI that works under Geneva is the NEODESK CLI which requires NEODESK too.

Later...

Hi all!

A short time ago there was discussion here after a posting from Derryck about altering keyboard shortcuts with RSCView or RCS editors. I have now had a long discussion about this with Holger Weets (well-known German author of ST-Guide, Finder, RSCView and many other fine progs) and some of the points he made may be of wider interest (though exprienced programmers will no doubt know them):

Menu shortcuts: He says that quite a few modern programs can read the shortcuts directly from the RSC file (or RSC portion of the PRG file if there is no separate RSC) so they are easily changed during translations if necessary. However, the original programmer has to write code in a way that implements this - Holger does not know of any library that does this automatically.

Note however that some programs use the Scancode rather than the ASCII value to evaluate the key pressed, and this may give problems with keyboards having a different layout from that used by the programmer (such as the swapped Y and Z of German/English&US keyboards, the Umlauts etc).

But on many programs the shortcuts are not in the RSC portion but hard-coded elsewhere; these can only be changed with a disk monitor -- if one can find them!

Dialog shortcuts: Many (?older?) RSCs use a '[' in front of the letter that is to serve as a shortcut when pressed together with ALT. This is a feature of some GEM libraries and so will only work if the programmer has used one of these.

The alternative of using the Whiteback flag to activate the shortcuts together with ob_state flag(s) to specify the position of the underlined character in the string was originated by MagiC, but also works when running under TOS if the programmer has written the code to make use of this feature; when running under MagiC (but not TOS) one can also update old programs that do not have this code to use this shortcut method as long as their dialogs are displayed/evaluated by the system.

Hope this is of some interest!

Happy New Year to you all

Regards
        /Peter/

As an ongoing attempt at improving my C coding style and approach I though I would have a bash at writing some code in Lattice which uses STing for its communication.

Now to this end I haven't done much but have noticed that a header file (ping.h) is missing from the example source code for the ping utility. Anyone know where I can get this missing file? Also are there any other examples of using STing (especially those written using Lattice C) ?

Thanks.

Spencer

: fashion, or even 4096 on a STANDARD ST (or 19200+ on STe), any way of
: increasing colours in medium res

That _should_ be possible using the same method as 512 colour display
(ie. palette switching in scanlines). You'd probably get less than
512 colours though, but I guess that something like 8 or 16 colours per
scanline should at least be possible?

: -- or even introducing some greyscale
: to high res mode?

That has been done, usually with a hell of a lot of flickering though...

: Even just four greys. 16 colours in medium res +
: 240-line overscan + your interlace program + a flicker-reducing filter =
: a passable VGA resolution display..!

And no CPU time left. :-) (presuming you'd have enough CPU time to
achieve the above)

By the way, does anyone have some commented Spectrum 512 (and/or 4096)
display code or know where I can find some?

You can found sources on my homepage, for Pure-C but probabely easy
adaptable for Lattice.

Olivier.

You don't have to know the structure of a resource file, and not much needs to be known about the structure of object trees either. It is enough to just make it look right and give names to those objects you need to access via code.

Menus and dialogs are both 'trees' the only difference being a menu has a more rigid format. The editor deals with that anyway. You need to find the option to create a "new tree".

By far the best way to figure out what is going on is to load the resource files from other applications. Use a copy though because some editors autosave.

Once you've created a new tree you'll typically have a G_BOX and this is the root object. Give it a name. You may drop other objects onto it and name the ones you need to manipulate.

Say you started with a new resource ...

Create a new tree. Name it F0.
Drop an editable object onto F0. Name this F0E0.
Drop a button onto F0. Name this F0B0.

Assuming C ...
Save the resource as C.RSC ensuring the option in the editor (if applicable) is set so that it writes a C header file. This will be called C.H

```
#include <yer_gem_lib>
#include "c.rsc"

int
main()
```

```
{OBJECT  *ob;

 appl_init();
 rsrc_load("C.RSC");

 rsrc_gaddr(R_TREE,F0,&ob);
 ob[0].ob_x = 20;
 ob[0].ob_y = 40;
 objc_draw(ob,ROOT,MAX_DEPTH,0,0,1000,1000);
 evnt_timer(5000,0);
 ob[F0B0].ob_state |= SELECTED;
 objc_draw(ob,F0B0,MAX_DEPTH,0,0,1000,1000);
 evnt_timer(5000,0);

 rsrc_free();
 appl_exit();
 return 0;
}
```

Now go back to the editor and ensure button F0B0 has its EXIT flag set. Save C.RSC and try this more useful example ...

```
main()
{OBJECT  *ob;
 int x,y,w,h;

 appl_init();
 rsrc_load("C.RSC");
 rsrc_gaddr(R_TREE,F0,&ob);

 form_center(ob,&x,&y,&w,&h);
 form_dial(FMD_START,1,1,1,1,x,y,w,h);
 objc_draw(ob,ROOT,MAX_DEPTH,x,y,w,h);
 r = form_do(ob,F0E0);
 ob[r].ob_state &= ~SELECTED;
 form_dial(FMD_FINISH,1,1,1,1,x,y,w,h);

 rsrc_free();
 appl_exit();
 return 0;
}
```

Thanks. I had a quick look at whilst at work but will download later.

BTW your homepage URL didn't appear to be 100% correct. I tried the
URL listed above which gave me a non-existant error so went directly
to the vcf-com directory which then allowed me to select your page.

Spencer

Hi!

Jo Even Skarstein <joska@nuts.edu> wrote:
> I'm interested!

OK, you'll find it at the bottom. My improvements were:

- Now allows quoted characters in ranges (e.g. [\[\]] to match either bracket)
- No longer reads past the end of malformed patterns

Of course, I can't guarantee I haven't introduced new problems, so beware ;)

Also note that this is not a POSIX-wildcard matching routine, as POSIX also wants character classes (e.g. [:upper:]). For such a beast, consult the source of bash (the UNIX shell).

Ciao

Thomas

Greetings Atarians,

and thanks for still answering my somwhat stupid
questions!

Now I wonder if there is a way to determine the
border thickness of various objects, as textboxes,
buttons and such. In short, determine the total
visible area of an object including outside borders
and shadows.

Thanks in advance,

Joakim

Yes, you can use the AES-call objc_sysvar. It's documented in the
Atari Compendium, if you don't have it let me know and I'll mail you
some info.

I may do a newsletter type thingy next year (or even next month) - but I need your stuff.

Any letters, articles, etc. could you please send to me, preferably in an image (it's gonna be based on DEGAS pictures) any format - I don't care. But you can send them by ASCII, which *is* a lot better.

PS. To receive it if/when it comes out, email me

PPS. It'll be a lot better if I could get my hands on a program called Atari-Text - I think it's shareware, not sure. If anyone could tell me where I can get it from, I'll be greatly appreciated.

Since I don't own the Compendium I'd really
appreciate if you'd send me some details. I
don't know if it matters, but I am using GFA
for programming.

Also, I heard something about that objc-
sysvar requires a newer AES.

Anyway, thanks a lot,

Joakim

In case you didn't see it in the newsgroups my new CD entitled "The
Atari ST PD Collection" was released over the weekend. It contains
over 200 meg of all types of PD software including Demos, Games,
Music, Internet Software, and Diskmags.

There is also a Spectrum CD which contains over 5000 spectrum games

plus Atari ST and PC emulators to run them. All the old favourites are included such as: Manic Miner, Jet Set Willy, Chuckie Egg 1&2, Hypersports, Jetpac, Atic Atac, Green Beret, Mikie and many many more.

Both Cds cost a fiver each plus + 1ukp P+P UK (Rest Of World - Add 2 pounds) and can be obtained from

27 Turbary Walk
Milnrow Rochdale
OL16 4JN
England

Also availible is "The Megadrive Collection" which includes over 250 megadrive games plus PC Emulators.

Cheques/Postal Orders made payable to D Sharples

The first parameter is the mode. MultiTOS's mode 0 which launches a process depending upon it's file extension ie. .TOS would be in the TOSWIN window, .PRG would be normal GEM etc. etc. does not exist in MagiC!
So in MagiC you must use mode 1, which has the unfortunate handicap that *you* must specify how the program is to be run. ie. is it GEM or TOS. That's that the second parameter is for. 1=GEM, 0=TOS.

>It does, but only if it is a program with extension .prg or .app.
>MagiC refuses to run .tos and .ttp programs with shel_write.

Not here it doesn't. I've just tried it. :)

shel_write (1,1,100,exe,cmd) will launch the program as a GEM app.

shel_write (1,0,100,exe,cmd) will launch it in VT52. I had some very weird effects when I launched LINES.APP in TOS mode. I don't recommend it. :)

As I said above, it seems MagiC doesn't have the *smart* mode that works out itself whether an app is TOS or GEM, but *you* have to decide instead. Seems a bit stupid to me that!

Just giving it a bit of thought, I guess it wouldn't be *too* hard to code around it. Might do that in SPAWNER actually. All you need to do is check the extension of the app your about to launch, and if it's .TOS or .TTP then use shel_write (1,0,100,exe,cmd) else use shel_write (1,1,100,exe,cmd).

What about it Jos? I'd certainly like to be able to run the import, export, expire functions from Okami's menu in a VT52 menu :)

Gary

Quite a simple question really... I've been trying to set up a C++
system for my ST, but I think I'm missing something.

I've downloaded various versions of gcc (2.5.8, 2.6.3 and 2.7.2),
associated other binaries (as, ld, etc.) and the include/library
archives. C programs all compile and run OK, but when it comes to C++
I get linker errors link: 'cannot find stdc++.olb' (running g__.ttp
- renamed to gpp.ttp - from the 2.7.2 package).

My question is therefore: Is there a 'out-of-the-box' gcc kit that I
can download, or what else do I require to fill the gaps?

Thanks in advance,

    Gio

Hi to all coders here.
I was wondering if any of you had done, or had seen this kind of
program.

Quite simple (at least it seems):
a TSR that would emulate a hardware JOYSTIK position from the keybrd
cursor. A joystik is more a pain than anything, besides mine sucks.
And plug it in, out, pisses me off more than anything.
Any TSR like that outthere? if not, anyone see if it is possible to do
one? If yes, would anyone attempt such thing?
Bye. and Thanks..

I'm not sure if this is a good idea. I do not know the doex code of 7 ATM, but it certainly does not exist in older versions of TOS. So if you care about compatibility with other machines (you should ;-)) you should stick to appl_write for sending AES messages.

Cheers Peter

Talk about discouraging ... I had a bare-bones copy of MiNT working with MiNTnet on my C-Lab Falcon (TOS 4.04, 14 Meg RAM, 500 Meg drive at 0,0), but was limited to 25 megabytes of disk space 'cause I didn't have the partitions XHDI formatted.

No problem, I figured, I'll just change the partitions! If only....

So here's what I did (my question is WAY down there):

I got HDDriver 7.55, and created six lovely partitions on my 2,0 Fujitsu (external) drive:
G: 16 Meg (GEM)
H: 32 Meg (GEM)
I: 200 Meg (BGM)
J: 200 Meg (BGM)
K: 32.8 Meg (BGM)
L: 32.8 Meg (BGM)

Changing the BGM partitions to MIX (for minix) caused the partitions to disappear from the desktop. Minix couldn't find them either.

Worrisome was the fact that HDDriver was counting drives beginning
with D: instead of C:, making my 2,0 partitions H-M instead of G-L.

So I left the partitions as BGM for the purpose of access and removed
HDDriver, restoring the ICD driver that I was using originally. The
drive-count problem was cured, and G-L were accessible as G-L with
both single TOS and MultiTOS..

Firing up MultiTOS (circa March, 1993), I started minit.ttp with these
options to get partition I ready to go: -V -P -n 2 I:

Minit promptly failed stating:
Cannot access Drive : Physical lrecno error".

----- Here are my questions -----
1. How do I convince minit.ttp to format my I: drive (...and also my
J:, K:, and L: drives)?
2. Where in the process do I change the partition types from BGM
to MIX?
3. Is there a definitive reference guide to minit.ttp and the minix
operating system? A book or web page of detailed commands
and tutorial would certainly be appreciated!

Thanks!

Hi!

In article <3653ca3a.2147495@news2.tmisnet.com>,
     strads@tmisnet.com (George Crissman) writes:
> 1. How do I convince minit.ttp to format my I: drive (...and also my
> J:, K:, and L: drives)?

You don't want to format, you want to install a filesystem. Beside that,

you'll need HDDRIVER or another XHDI-compliant driver. ICD's drivers has always had problems with the physical Rwabs()-modes, and does not support XHDI, either.

> 2. Where in the process do I change the partition types from BGM
> to MIX?

Anytime, but make sure you have an XHDI compliant driver *AND* that it recognizes MIX as an additional XHDI partition type with BIOS-, but no GEMDOS access. If you use RAW instead of MIX, this will not be necessary, as RAW is a standard XHDI type with these features, recognized by all compliant drivers by default.

In HDDRIVER, you'll need to add MIX to the list of additional XHDI partition types, I think it's in the dialog for advanced options. But as said, RAW will work, too, without having to tell the driver about it. MIX is just a more precise description of what type the partition actually is, but doesn't change the way it's handled by the driver or by MinixFS.

> 3. Is there a definitive reference guide to minit.ttp and the minix
> operating system? A book or web page of detailed commands
> and tutorial would certainly be appreciated!

Moment, are you really trying to install Minix OS or not just only Minix FS for MiNT? Anyway, I don't know a better guide to minit than the docs that come with it. Of course, this doesn't mean this guide is well-done, nor does it mean that better documentation doesn't exist - I just don't of any other documentation ...

Ciao

Thomas

I agree - though I ought to mention ...

The behaviour of shel_write() could be due to command shells. Mine,
for instance, makes almost exclusive use of .PRG when in fact the
executables are just 'dos' programs. The idea revolved around the
premise that .TOS never took arguments, .TTP always took them, whereas
.PRG may or may not (or so it seems). I think (it being derived from

unix) that there may have been an issue concerning the ability of an app to decide itself how it is run - GUI or CMD, rather than forcing a mode upon it. Certainly there are one or two in my system that behave like this.

>Just giving it a bit of thought, I guess it wouldn't be *too* hard to code

Naturally, none of what I mentioned above is relevent these days. Any command shell worth its salt will allow trivialities such as extenders to be added, removed or changed. That done, a multiple rename of everything from .PRG to "sumfink more sensible" shouldn't pose any problems.

Having spouted all that, I just use .APP and .GTP for Gem programs, and have extended .PRG to mean "could be owt". ;-))

It'll run them - see Gary's reply for specifics.

I have a vague recollection of initially thinking the same myself however. It *may* have been something to do with the way my desktop (Ease) was set up at the time (perhaps some conflict with installed apps), or it *may* have been something to do with the environment (a variable perhaps). Unfortunately my LZH disaster means I can't get at the details.

Anyway, the end result was the output appeared on the desktop but I never noticed to start with because it got drawn over.

Btw, the return value: this'll arrive via a CH_EXIT message.

As far as I know, yes.

If the call did exist previously in an undocumented but functional
manner then someone else will have to confirm it.

Otherwise, the answer reverts to my other post - "tricky!" ;-)

This is tricky. It would help if you could give us some idea of what
it is you want to accomplish?

<snip>
: Changing the BGM partitions to MIX (for minix) caused the partitions
: to disappear from the desktop. Minix couldn't find them either.
: Worrisome was the fact that HDDriver was counting drives beginning
: with D: instead of C:, making my 2,0 partitions H-M instead of G-L.

This is expected behaviour; as far as I know, drivers are supposed to
ignore partitions whose type ID's they don't understand, on the
(resonable) assumption that that the filesystem is entirely different.

: So I left the partitions as BGM for the purpose of access and removed
: HDDriver, restoring the ICD driver that I was using originally. The
: drive-count problem was cured, and G-L were accessible as G-L with
: both single TOS and MultiTOS..

: Firing up MultiTOS (circa March, 1993), I started minit.ttp with these
: options to get partition I ready to go: -V -P -n 2 I:

: Minit promptly failed stating:
: Cannot access Drive : Physical lrecno error".

: ----- Here are my questions -----
: 1. How do I convince minit.ttp to format my I: drive (...and also my
: J:, K:, and L: drives)?

Don't use the ICD driver. It does not get along (for whatever reason)
with the minix file system when using large partitions. You're best off
with HDdriver.

: 2. Where in the process do I change the partition types from BGM
: to MIX?

You don't. At least, I didn't, and my minixFS partition works fine. IIRC,
by minixFS partition types are still BGM.

: 3. Is there a definitive reference guide to minit.ttp and the minix
: operating system? A book or web page of detailed commands
: and tutorial would certainly be appreciated!

For minix, I believe Andrew Tannenbaum (the originator of minix) wrote

book on it. Do a search on amazon.com. That said, you're probably not interested in minix itself, just the filesystem driver for MiNT. I found the documentation for minit.ttp reasonably clear (although I think it was in the source, rather than binary, distribution).

What do you want to know? Just about C in general programming C on the Atari (i.e. GEM)? For C in general then K&R is the definitive guide, for programming GEM-apps then C-Manship by Clayton Walnum is rather good, although outdated. "Professional GEM" is freely available on the net and very good if you already know some C.

> Have or will have Prospero C...Dont need guidence on getting another C
> package thank you as this is the only one I can get a hold of..

Prospero is rather outdated, depending on what you want to do you probably want more modern libs. gcc is free and works fine as long as your ST has 4Mb and a harddrivev. If you want to port DOS-applications (DJGPP is some sort of gcc-derivate, isn't it?) then gcc probably is your best bet.

> So please point me in the right direction for tutorials.. hey and if
> theres an idiot guide then all the better :)

There has to be a "C for dummies" available, check your bookstore. But

I'd rather recommend K&R (Kernigan & Ritchie - The C Programming Language) which all you need if you already know what programming is all about.

Thats right. I used ICD's Pro Utils (v6.5.5) with my first Mint installation, and 64 megs is the biggest Minix partition you can use with it. Do like Theo says, get HDDriver... ;-)

Yeah, but HDDriver's acting really flakey for me! All of my drive C:
stuff shows up on drive D, and the icon for drive C just stays
selected when double-clicked (for about 10 seconds) then deselects
and nothing else happens.

And ... when I select "MIX" for the minix partition, the partition
disappears, even to minit.ttp! So far, I have managed to wall off
almost all of my external drive, trying to get HDDriver to work.
The only recovery that works for me is ICD's driver and utiliities.

Uwe Seimet was very attentive to my email for help -- he answered
within 12 hours (WOW!! Thank you, Uwe!), but the answer was
"you'll need to ask someone else" because he doesn't use minix
that much.

Fortunately, the "someone else" that Dr. Seimet recommended has
emailed me a fresh copy of minit.ttp -- hopefully this'll help.

Thanks!

I guess that the funtion is needed most for
the action on my 3d-buttons.

I have written my own routines to enable
correct clipping when updating window
content and everything is now working very
well even in background mode. But when
updating an object through objc_draw with
clipping rectangle specified by ob_x,y,b,h
then the (if present) outside border won't be
updated. For now I have a very temporary
solution to this. I assume that if the 3dflag is
set, an outside border of 2 pixels is present.

This is a very bad solution (and only works
for 3dbuttons), I know, but I am
not a very experienced programmer and
haven't found any other solution yet.

I just thought I should ask if there is some
way to determine the outer limits of an object
(3d or whatever) including borders, since I
felt it wouldn't be very strange if such a
function existed.

Maybe I am doing everything in a way that is
not the smoothest, but I don't know...

However, if I could use the objc_sysvar,
would it cause on older AES to crash, or
would it just ignore it?

Regards,

Joakim

what about a 6301 code (keyboard controller) ? I think mouse emulation
(alt+arrows) is done that way.

Eric

I suspect HDdriver may be having problems with ICDFMT's
(AHDI-incompatible) extended partitioning scheme. This is happens when
you have more than four partitions, and the "AHDI compatible" option was
not selected when partitioning your hard drive with ICDFMT.

: And ... when I select "MIX" for the minix partition, the partition

Like I said, you don't need to change the partition type to "MIX" (or
anything else, for that matter). Leave it as BGM, oherwise (as you've
experienced) the driver will ignore the partition.

This may be overkill, but I would suggest backing everything up (always a
good idea anyway, when you're messing about with changing file systems
and partition types [as I know from personal experience :P]), and
repartitioning your hard drive (using ICDFMT) with AHDI compatibility ON.
(Ignore if your drive was previously partitioned this way...)

Hi!

gokmase@my-dejanews.com wrote:
> I just thought I should ask if there is some
> way to determine the outer limits of an object
> (3d or whatever) including borders, since I
> felt it wouldn't be very strange if such a
> function existed.

For just getting the dimensions of an object including borders, outlines, etc., use the following:

Save the object's current position and dimensions, then call form_center() for this very object. You'll find the full width and height of the object in the centered coordinates returned. Then use the new position and dimensions of the object to calculate the x- and y-offset. Now restore the saved position and dimensions of the object and use the offsets and the width/height returned by form_center() to calculate your clipping rectangle.

Example (written from memory):

```
/* tree: Pointer to object tree
 * obj: Object number of object in question
 */

    int16   x, y, w, h,
            xoff, yoff,
            ox, oy, ow, oh;

    ox = tree[obj].ob_x;
    oy = tree[obj].ob_y;
    ow = tree[obj].ob_width;
    oh = tree[obj].ob_height;

    form_center(&tree[obj], &x, &y, &w, &h);
    xoff = x - tree[obj].ob_x;
    yoff = y - tree[obj].ob_y;

    tree[obj].ob_x = ox;
    tree[obj].ob_y = oy;
    tree[obj].ob_width = ow;
    tree[obj].ob_height = oh;

    x = ox - xoff;
    y = oy - yoff;
```

```
/* x, y, w, h now contains the full position and dimensions of
 * tree[obj]
 */
```

Note: No guarantee ...

> However, if I could use the objc_sysvar,
> would it cause on older AES to crash, or
> would it just ignore it?

Neither nor. An AES without this function will display an alert "Illegal AES function" (or similar), but not crash. Of course, your program might crash afterwards if it uses the result of the call which actually doesn't exist. Therefore, appl_getinfo() exists to determine whether a certain feature is supported by the current AES.

Ciao

Thomas

If you want to update a specific object, then set the
clipping-rectangle to the rectangle retrieved from the window's
rectangle-list and do a objc_redraw() on the object you want to
redraw. There's no need to set the clipping-rectangle to the rectangle
of the object at all (unledd I've misunderstood your intentions).

Get K&R. It's not really a tutorial,but very good if you already know

another language and want to learn C.

>>Atari (i.e. GEM)? For C in general then K&R is the definitive guide,

> where do I get that ?

The bookstore. "The C programming language (ANSI edition)" by Kernigan
and Ritchie. I only have the ISBN-no. for the Norwegian version,
sorry.

>>for programming GEM-apps then C-Manship by Clayton Walnum is rather

> and that ?

Ditto. "Clayton Walnum's C-manship complete", published by Kuma.

>>good, although outdated. "Professional GEM" is freely available on the
>>net and very good if you already know some C.

> But where please ?

Every ftp-site, it's called "PROGEM.ZIP" or similar. If you can't find
it let me know and I'll mail it to you. But this is really a
GEM-tutorial, you'll have to know some C already.

>>There has to be a "C for dummies" available, check your bookstore. But

> books ?.... sorry I meant i was looking for information on the
> internet.. hence my reason for asking on the internet..

'www.c-for-dummies.com', djgpp-oriented.

HI, Theo!

I appreciate the ongoing help -- it's making a difference!

>: Yeah, but HDDriver's acting really flakey for me! All of my drive C:
>: stuff shows up on drive D,
>I suspect HDdriver may be having problems with ICDFMT's

>(AHDI-incompatible) extended partitioning scheme. This is happens when
>you have more than four partitions, and the "AHDI compatible" option was
>not selected when partitioning your hard drive with ICDFMT.

Hmmm ... my onboard hard drive is in 4 partitions using ICD.
My outboard drive was completely reformatted using HDDriver
into six partitions:
16 Meg, 32 Meg, 200 Meg, 200 Meg, 36 Meg, and 36 Meg.

So the problem is my onboard drive causing fits for HDDriver?

>: And ... when I select "MIX" for the minix partition, the partition
>: disappears, even to minit.ttp!

>Like I said, you don't need to change the partition type to "MIX" (or
>anything else, for that matter). Leave it as BGM, oherwise (as you've
>experienced) the driver will ignore the partition.

The documentation I was following (it has conveniently vanished)
was suggesting that the partition type should be designated MIX,
so I was trying to follow the instructions. If not necessary, so much
the better.

>This may be overkill, but I would suggest backing everything up (always a
>good idea anyway, when you're messing about with changing file systems
>and partition types [as I know from personal experience :P]), and
>repartitioning your hard drive (using ICDFMT) with AHDI compatibility ON.
>(Ignore if your drive was previously partitioned this way...)
>
>THeo

Hi folks!

I hope my request isn't too far from the usual GEM-line, but any idea
where to get material on how to do fast real-time texture mapping for a
3D-space simulation?
Both general information and source code would be appreciated.

Thanks, Michael.

You will almost certainly need the 'C Bible' next to you, Tony. It's the 'C Programming Language' by its originators, Kernighan and Ritchie. BUT ... this is no idiot guide - just a definition of syntax/semantics.

When I was last looking on the library shelves I saw quite a number of jokey, US, paperback tutorials. One of these should be easy to digest.

You could contain such objects within an I_BOX of their own and clip
to that instead. Okay, so it works but it's "annoying". ;-)

>I just thought I should ask if there is some
>way to determine the outer limits of an object
>(3d or whatever) including borders, since I

Thomas's solution is the only way to accomplish this under all Gem
versions. It is in fact the method used by Pug (a front end used by
all my Gem applications).

You should note however, that the area returned by form_center() may
not be exact. It will always be big enough to cause the object to be
redrawn correctly but it may be larger - older Gem versions weren't
too clever about it and included things like the shadowed feature even
if it wasn't being used.

aha! I know there must be a way.
People saying things are impossible for whatever reason are often
proven to be wrong..

As far as overwriting anything a TSR would do, well maybe a TSR is not
the answer, but another trick is surely possible. As you can even run
STgames on a pc with emulation. so, anything is possible. At the
worst, emulating the hardware (joystick) via software, or whatever
way. it IS possible, just don't know how.
PPP on an atari ST? impossible.
WEB browsing impossible...
Realaudio on an atari? impossible.
mp2 songs on atari realtime? impossible...
etc etc etc. the list goes on.

I'm not actually interested in DJGPP as such. It's just that I got an
email regarding 16-bit programs and "modes" under NT

The only solution I could provide is KB [who_gives_a_toss] where you
do the "full screen" command line thingy and run it from there. Plays
hell with *my* monitor thought. Just wondering if others found it
worked or not?

I urgenty require a copy of Pure C for the further development of some
Atari
software. If anyone has a copy please e-mail;
johnr@thedruid.demon.co.uk. Or reply in this newsgroup. You could ring
me
voice before 21:30 on 01302 744241 (UK) although you'll be lucky to

catch me
around. :)

Thanks.

John.

> Quite simple (at least it seems):

Famous last words. :)

> a TSR that would emulate a hardware JOYSTIK position from the keybrd
> cursor. A joystik is more a pain than anything, besides mine sucks.

I think what you ask for is neigh on impossible. :(A lot of games have
their
own joystick handling code that accesses the hardware directly,
overriding
any user patches.

However, as far as the hardware is concerned a joystick action is just like
pressing a key on the keyboard. If you are handy with a hex editor and/or
disassembler it is possible to hack individual games.

I don't have all the details to hand but basically the procedure is something
like;

Find the joystick code. Do this by searching for access to the keyboard
hardware by the program, if you have a disassembler this will be much easier,
if not then you'll need to convert the mnemonics into hex code and do the
search that way.

Once found, the code should take the following form:

```
   if keypress = joystick_up then goto do_upwards
   else
    etc...
```

All you need to do then is change the value in joystick_up to the value of
the key you want to replace it with. You should be aware that the hardware
sends two codes for each keypress, one when you press it and another when you
release it. The release code is the same as the press code but with the high
bit set. The game program will take account of this and you need to be on the
look out for it.

All the hardware addresses and keyboard codes should be available from
somewhere on the net, if you can't find them and you want them I'll e-mail
them to you.

John.

Hi!

Another correction/addition:

form_center() does _not_ respect shadows, i.e. my method won't work for
objects with ob_state & SHADOWED set. OUTLINED works, however.

Ciao

Thomas

Not to me, considering that there is no reliable way to find out ! The OS can
"guess" based on the extension, that's all, but a *.PRG Extension does not mean
that it will call appl_init() and refrain from using the console.

Cheers Peter

When I read about Katherine's joystick problems (See "Looking for small TSR.") I remembered that I have not examined the 6301 code yet even though I've owned ST computers for almost 10 years.
Could someone please tell me where I can get the 6301 instruction set complete with descriptions and bells and whistles so that I can explore this unknown land. (Or even better send it to me.)

Hi,

The Hitachi 6301V1 used in Atari computers is said to be compatible with
Motorola's 6800 micro-controller, so you can esaily get docs about this one.
In old French "ST-Magazine" (No 53 & 55) there are the opcodes of the 6301, how
they
work and how they are coded in hexa. It also explains how the chip handles
the keyboard. Most of instructions are 16bit long, and the available RAM is
128 bytes. I've got this doc, it will be hard to find time to type and
translate it, but if you need infos on some particular point, don't hesitate
to ask me :)
If you begin to work on it please e-mail me as I'm also interested in
a 6301 assembler/disassembler.

Vincent

Newsgroups: comp.sys.atari.programmer

I'm experimenting with editing RSC files (with RSCView FWIW) with a view to changing/adding keyboard shortcuts to those programs that either don't have them, or use the ALT+key combo in menus where it's more common to use the CTRL+key.

Three immediate problems then, editing a menu string to remove the ALT symbol and replacing it with the carat used to indicate the CTRL key doesn't make the CTRL key take over as the modifier - can this done?

Secondly, how do I enter the "box" character from the keyboard to restore the symbol used to indicate the ALT key?

Thirdly, what about adding keyboard shortcuts to dialogs. I can see that ticking the "whitebak" box in RSCView underlines the first character and lo, this letter becomes the shortcut in conjunction with the ALT key, but how do I make another letter the shortcut (to avoid any clashes!)

I'm running MagiC 6 on a Falcon.

Thanks in advance from a non-programmer! :-))

: I'm experimenting with editing RSC files (with RSCView FWIW) with a view to
: changing/adding keyboard shortcuts to those programs that either don't have
: them, or use the ALT+key combo in menus where it's more common to use the

: CTRL+key.

Editting the resource file is not normally the way to add keyboard shortcuts.

: Three immediate problems then, editing a menu string to remove the ALT
: symbol and replacing it with the carat used to indicate the CTRL key doesn't
: make the CTRL key take over as the modifier - can this done?

Most programs do not check their resource file to see what their keyboard shortcuts should be; keyboard shortcuts are usually hardcoded into the program. (IMO, I think keyboard shortcuts should be taken from the resource -- IIRC, Everest allows this to be done.)

Geneva allows something along the lines of what your want -- the user can add keyboard shortcuts to the menu tree, and Geneva itself (rather than the application) checks to see whether keypresses correspond to any of the menu entries, and sends the aprropriate menu message to the application.

You may be able to fake things using keyboard macros.

: Secondly, how do I enter the "box" character from the keyboard to restore the
: symbol used to indicate the ALT key?

You should be able to type in the appropriate ASCII code using ALT and the keypad; if you don't have an Atari ASCII table handy, just go by trial and error, since the ASCII code is not very high. I.e., type in ALT-000, then ALT-001, and so on.

: Thirdly, what about adding keyboard shortcuts to dialogs. I can see that
: ticking the "whitebak" box in RSCView underlines the first character and lo,
: this letter becomes the shortcut in conjunction with the ALT key, but how do
: I make another letter the shortcut (to avoid any clashes!)

I think the standard way of doing this is to put a [in front of the character that you want to be the shortcut. Geneva, at least, allows this.

Keyboard shortcuts are (usually) built into the program and unless
there's a feature of the program to change them (as in Connect),
you're stuck with what's there.

>Secondly, how do I enter the "box" character from the keyboard to restore the

This is probably a feature of Magic. Let'm'Fly does the same thing,
with the ALT shortcuts being assigned alphabetically, if I recall.

I thought that this would be the case - however the HYP that accompanies
RSCView suggests that this can be done (alter menu shortcuts).

This might be the type of program that the HYP is referring to, I'm
experimenting with Personal Finance Manager Plus, quite an elderly program
but one that definitely benefits from keyboard operation.

>Geneva allows something along the lines of what your want -- the user can
>add keyboard shortcuts to the menu tree, and Geneva itself (rather than
>the application) checks to see whether keypresses correspond to any of the
>menu entries, and sends the aprropriate menu message to the application.

That sounds like a worthwhile plus.

>You may be able to fake things using keyboard macros.

I can't see a way of doing that ATM.

>: Secondly, how do I enter the "box" character from the keyboard to restore the
>You should be able to type in the appropriate ASCII code using ALT and
>the keypad; if you don't have an Atari ASCII table handy, just go by

This doesn't work (I'd already tried it), all you get is the string of
numbers entered in the input field. However it's possible to use CTRL C and
V in turn to copy and paste if necessary.

>: Thirdly, what about adding keyboard shortcuts to dialogs. I can see that
>I think the standard way of doing this is to put a [in front of the
>character that you want to be the shortcut. Geneva, at least, allows this.

I've seen this in other programs, I'll try this, thanks.

I've used this feature before and was bemused that all kinds of objects were
being assigned shortcuts as well as the intended buttons! :-))

Any other ideas anyone please?

A few months ago there was a discussion here about how to change the
contents of an AES window info line. At the moment I'm using this (in
GFA Basic):

```
adr_info%=V:info$
~WIND_SET(handle,3,CARD(SWAP(adr_info%)),CARD(adr_info%),0,0)
```

and when the info contents are changed, I get garbage characters at
the end of the INFO line as well as the TITLE line of another window.

How can I change the INFO line cleanly?

The strings have to be null terminated like so:

info$=info$+chr$(0)

>adr_info%=V:info$
>~WIND_SET(handle,3,CARD(SWAP(adr_info%)),CARD(adr_info%),0,0)

Sounds like your string isn't nul terminated! All strings used by the
operating system are C strings - you have to ensure the byte after the
last character is '\0' (ie chr$(0)).

Newsgroups: comp.sys.atari.programmer

Not only should your string be NULL-terminated, also it's better NOT to
store it in a string, because they get shifted around a lot in memory:

```
* Use a numeric array:
              DIM wintitle|(SUCC(LEN(info$))
              adr_info%=V:wintitle|(0)        ! OPTION BASE 0 !!!
* or a MALLOCed piece of memory:
              adr_info%=MALLOC(SUCC(LEN(info$))
* or an INLINE:
              INLINE adr_info%,amount_of_memory_needed
```

The string can now be written to this memory with the CHAR{} command, which automatically adds the terminating null-byte:

```
              CHAR{adr_info%}=info$
```

now you can safely update/set your infoline with

```
 ~WIND_SET(handle,3,CARD(SWAP(adr_info%)),CARD(adr_info%),0,0)
```

the same rule applies for window titles.

Greetz,

What do you want to do with it? If you want to make GEM-stuff, then get "Professional GEM" by Tim Ohren, it's available on every Atari ftp-site. (And soon on www-atari.nvg.ntnu.no/programming/)

If you want to make games... Well, you don't need any C-specific stuff then, any hardware-reference will do. But it helps to know assembly

;-) ST-News had some excellent articles about this almost ten years
ago, you can find lot of useful info there.

Hello everybody,

I just installed the gcc-2.8.1.c and got trouble with the linker now, which reports a lot of Symbols defined in more than one modul. But these are all inline functions frome class definitions and so they shouldn't be found in the modules. Have I forgotten some compiler switches or is the linker buggy?
Two switches I found myself: -fno-rtti and -fno-exceptions, to avoid errors about missing symbols '__rtti' and '___throw'.

Thanks, Ralph

The WHITEBAK turns it on as you've discovered. In order to specify
which key you need to place its offset into the high byte of

ob_state thus ...

```
ob[obi].ob_state |= ((pos << 8) | WHITEBAK);
```

... where 'pos' denoted where the underline is, offset from zero.

> key doesn't make the CTRL key take over as the modifier - can this
> done?

Simple answer no. :(Short cuts such as these have to be hard coded into the actual source of the program. I don't think there is any simple solution except to ask the original programmer to change it.

> Secondly, how do I enter the "box" character from the keyboard to
> restore the
> symbol used to indicate the ALT key?

It'll by CTRL+somekey, experiment!

> Thirdly, what about adding keyboard shortcuts to dialogs. I can see
> that ticking the "whitebak" box in RSCView underlines the first

> character and lo, this letter becomes the shortcut in conjunction with
> the ALT key, but how do I make another letter the shortcut (to avoid
> any clashes!)

This is purely a feature of the Magic OS, and will not work under normal TOS.
Unless it is coded into the software directly.

I'm not sure of the answer to this, but if you look at the resource file with
an old editor such as ORCS, you'll see that the underlined letter is always
preceded by a '['. It could be worth a try.

John.

I know a problem with the old Gas 1.9, you can try option -O1 to pass the
problemor change of version of Gas, there is a good one number 2.8 I
think, I'm sure it could resolve your problems.

Hi all,

I am trying to get to grips with GEM programming but I am finding it quite difficult. I am currently using Hisoft Basic and the excellent Enchant libraries which is making a good part of programming for GEM easier, but I am still finding that I do not know enough about GEM as I would like.

Can anybody suggest some good WEB sites, or books that explain how to program for GEM (not necessarily for Basic) and which contain examples and downloadable source code?

Thanks.

Regards,

Ben Hills.

For lots of sourcecodes you could download the ICTARI disks (all programming languages) at

http://www.elis.demon.co.uk/ictari/ictari.htm

The 'classic' articles on this were by Tim Oren, Ben, and were
released PD. I don't have any specific site in mind but I bet Umich
will have them.

But not the only one. With any Basic, whenever you change the contents of
a string, the Basic is allowed to use a different spot in memory, so the
actual address of the string changes. Thus you need to do that wind_set
call each time the string is changed (maybe you do so, but it sounded as
if not).

Cheers Peter

Aha! That's a great help - I can now adjust the position of the underline
and hence the keyboard shortcut. About the only tweak I didn't make, so
thanks! :-)

A limited success story with Personal Finance Manager Plus tho', the
underline and the ability to use the shortcut disappear after you've used it
and doesn't reappear until the next program load - wierd! :-(

 d> Three immediate problems then, editing a menu string to remove the
 d> ALT symbol and replacing it with the carat used to indicate the CTRL
 d> key doesn't make the CTRL key take over as the modifier - can this
 d> done?

I know very little about programming but I have translated a number of RSC
files as you know, and got some experience re your problem. The thing is that
some programs read the shortcut directly from the menu entry in the RSC
file but others (?most) don't - they are hardcoded in the PRG file (I think).

Sometimes this can be changed if you can find the correct spot :-(

 d> Secondly, how do I enter the "box" character from the keyboard to
 d> restore the symbol used to indicate the ALT key?

Use Alt+007 (number-pad) in the usual way; this works in RSCView (have checked).

 d> Thirdly, what about adding keyboard shortcuts to dialogs. I can see
 d> that ticking the "whitebak" box in RSCView underlines the first
 d> character and lo, this letter becomes the shortcut in conjunction
 d> with the ALT key, but how do I make another letter the shortcut (to
 d> avoid any clashes!)

In some programs (e.g. Thing) this is done by setting the ob-state extended flags '8' to '14' (those under the second column in RSCView) counting in binary mode, with the text string position starting from 0; thus no flag set will underline the first character of the string (i.e. position 0) and use this for the shortcut, the first flag ('8') set underlines the second char., the second flag ('9') the third char., both '8' and '9' the fourth, '10' the 5th, '8' and '10' the sixth etc.; '15' should not be touched as it has some special function, and all from '8' to '15' set means don't use a shortcut for that entry.

Other resourse files have an opening square bracket '[' in front of the relevant letter and I have also seen other symbols used for this -again it depends on how the programme is coded (may have something to do with the compiler used).

Regards
        /Peter/

Yes, that seems to be the concensus. It's a shortcut on the programmer's part because having a redifinable version makes multilanguage support much easier.

>Sometimes this can be changed if you can find the correct spot :-(

Yep, this works but only under single TOS it seems. There's a couple of bugs that I'll need to email Holger about.

As he said, it's a C and C++ compiler, more widely known as GCC.
Needless to say, there are lots of GCC versions available for the Atari,
so there's no need to switch to another compiler. Some of the others
may be easier to use thanks to IDEs, but GCC beats them all when it
comes to optimization and code generation.

>I'm not actually interested in DJGPP as such. It's just that I got an

I don't think GCC ever supported 16 bit mode on PCs.

Hello everyone!

I have the following atari Compute's books for sale:

"Compute's first book of atari graphics"

"Compute's second book of atari graphics"

"Compute's first book of atari games"

"Mapping the Atari, 1st edition"

All of the books are in good condition and are priced at $10.00 each plus shipping. I would suggest the 3 day shipping as it is only $3.00 and gets the books to you quickly at a reasonable price. Please e-mail me if you are interested in any of these. Thanks!!

Rather perversely, hard coding keyboard shortcuts is one of those
situations where you end up with a big if/then/else construct, or
similar. Not only is this an indication a better method ought to be
sought, it involves more effort than doing something generic!

The menubar is easy: walk tree, locate shortcut, issue self equivilent
MN_SELECTED message!

Ah, sounds like they've screwed up. Part of the specification of the
Gem design was that things it doesn't understand ought to be ignored.
Moreover it ought to be preserved. They've most likely set the whole
of ob_state to some value rather than using masking to manipulate just
the bitfields which were "understood" at the time.

Curing this would involve hacking the executable. :-(

Hi

I've just got my hands on a Pioneer DRM-624X a 6 x CD-ROM changer. It's
a SCSI device and uses LUN numbers from 0-6. E.G.. Drive ID=5 lun=0,
drive ID=5 lun=1 etc...

How do I get Extendos (v2.4) to enable me to use this drive fully; or is
there another package for the Atari ST that would do the job?

Any help will be more than appreciated.

Sometimes, resource editors allows you to type a "Control-G" in a text
entry line in a dialog to get the "Alternate" character.

Some explanations and example can be find
here:http://www-air.inria.fr/People/bereziat/gem.html

But it's in french, examples are in C.

You can use Mesa, it's a very good OpenGL like, all sources are
avaiblehttp://www.ssec.wisc.edu/~brianp/home.html

For real time it's a little bit hard if you have not an Hades60.

I port it for Atari like dynamic library and it can be use for PureC and
GCC for the moment
and it's not to hard to port it on other language. but it's in french!

Read the documentation. Each LUN becomes one drive letter, so you would have
D:, E:, F:, G:, H:, and I:. It's a simple configuration ASCII file.

Web site udpating:

  After technical problem with our accommodation, our web site was broken.
Actually, he is running correctly with many modifications in bonus.

  - a page with french and foreigners distributors.
  - a page with various links wich claims to grow...
  - a quick access to tested softwares on CENTurbo II (163 refenrences).
  - a CT2 FAQ in the softwares page of CENTurbo II menu.
  - new version of CBOOT 1.0.8, PUTFLASH 1.0.8 + FLASH.BIN 1.0.2,
    CENTscreen 3.4.0, VIDEOMOD 1.2.0. All from 12/08/1998.
  - new version of CENTview 2.9.0 from 11/25/1998.
  - new version of CECILE Demo 1.84 form 11/10/1998.
  - new version of SANDRINE Demo 3.0 from 05/11/1998 that you can use to really
    scan but with colorless :-)

CENTurbo II: Available in January 1999

  The CENTurbo II revision B is in productions. She will have a new hand-made Fast-Ram controller (same on the Phenix) and more quickly.

  A better integration permited to decrease the price to 1890FF TTC !

  The serie will be limited, contact your resellers...

Phenix:

  The prototype is routing phase according to the last implantation (see Phenix page).

  We finish the USB and PCI validation at the moment (hardware and software!).

  The DSP+20-bit audio part is valid.

Thanks for your attention.

Hi,

To save you all the trouble, I have a small program which puts the Atari
into
640x800. Let me know if you want it and I shall email it to you.

As for the Line-A docs, I have a book which covers this stuff but it isn't
for
the faint hearted!!! ;o)

Regards,

Stephen.

If you don't mind, please send it to the above email adress. Does the
program also operate on other (OverScan) resolutions ? If not, i would still
be very interested in the program. How much CPU time does your program take ?
Or is it ajustable ? have you used the HSYNC of the MFP, or the HSYNC of the
MC68k ? I have a manual for the Line-A, but I was wondering if anyone had
some more experience with tweeking the LineA.

Aryan

the package you have can handle it, as can the new Extendos Gold.
In Extendos Gold they also have an installer that has screens for
you to set up the multi changers - but I don't think this existed
in the older version. Wayne

Hello,

I'm looking for source code or explanations on how to play
sound samples on a standard atari ST.
I search an answer in many docs and papers but didn't found anything,
so any help would be appreciated.

I'm writing a MIDI librarian program in GFA Basic. The code works fine in the interpreter, but the compiled code seems to be having problems with the MIDI data and I get a lot of glitches.

However, if I switch to 8Mhz (from 16Mhz on MegaSTE), the compiled code behaves itself.

Any ideas what I can do to correct this? Would it be acceptable to have my program switch the computer to 8Mhz?

I tried putting a 1/5 second pause in the code. This helped, but not 100%.

Hi

Do you use BIOS calls Bcostat, Bconstat, Bconin and Bconout or do you directly
access the Midi ACIA registers ?
If you use BIOS calls, I don't see any reason why it shouldn't work, but if
you use direct access to the MIDI registers, you might have forgotten to
wait for the ACIA to be ready to give you or send a byte.
(bits 0 and 1 of $fffc04).

I've written similar stuff in assembly langage and it works perfectly at 16MHz
I hook the IKBD midisys vector and directly access the hardware, but when I
switch to 8Mhz it doesn't work correctly anymore if I have to get too many MIDI
messages at the same time. I suspect the overhead of the midisys vector to
be too long but if it's not the case it might fail for the same reason as your
program does.

It's not a good idea to switch the computer to 8Mhz because if you want your program to run with MiNT, it should respect others applications ! And anyway it is to the software to accept the hardware.

Vincent

I've been using all these BIOS calls except Bcostat (check output
status). It hadn't occurred to me that I might need this, because the
MIDI buffer is cleared before any new transmission.

I'll try incorporating this call.

Yes! You're right. The program now runs correctly, but I still have the warning "implicit decl of getche". Should I concern myself with this?

Don't know what the warning is about but there is an error in your code.
You're trying to assign ch with the return from getche() but what you did with 2 equal sign ("=") is a comparison operation. It should be single equal as below:

```
  ch = getch();
```

Hi.

Does anyone have a comparison of GFA basic, HISOFT basic, and STOS Basic?

Does anyone know where I can get them?
I have tried everything but still cant get a hold of them.

Thanks!

It means that the prototype for getche() was not found in stdio.h.
Search the other include files for the prototype and #include it as
well.

There is a patch for GFA-Basic that fixes the compiler library and
it's very useable once patched.

I think HISOFT is unsupported as well but I could be wrong.

STOS from what I've seen is great for games.

Someone else answered you on the warning message.
I don't use Sozobon at all, but could it be that the prototype is inside
tos.h or ext.h oe something equivalent ?

Otherwise just create the prototype yourself.

The first error is writing ch == getche();
In this case the returned value of getche() is not affecting the 'ch'
variable. Instead you should write :
ch = getche();

The warning can be avoided by prototyping the geche() function.
Type just before the main() function :
char getche(void);

```

The book that I'm learning from specified conio.h, which wasn't
included with Sozobon. I DL'd a conio.h file off the web, and it had
the prototype for getch() but not for getche(). So, as you suggested,
I created the prototype myself, and this cleared up the error.

Until yesterday, I had no idea what a prototype was. This is *all*
new to me, and I'm really glad that it's starting to fall into place.

Thanks for your help.

Isn't this the same as setmode()? I couldn't find a setsmdmode()
prototype in any of the include files.

Wrong, totally WRONG.
The new version of the homepage was installed but somehow this part
was overlooked. A pointer wrong to a file and...
Everybody get the old version 5.1 in his face.
Sorry, for the delay.
When it really pops up (why it doesn't is mysterious)
a new message will be posted.

No, no,
the thing here is: the contents of that left-ver byte is according to
the instruction description not used.
Nowhre there is declaired that thosebit should be zero.
Most compilers make those bit 0 but maybe not.
Also there are some clever programs that keep their secret licence
number in those bytes.
When you translate the instruction code to readable form: you cannot
see that byte-contents.
To make sure no information-los to the user takes place, no dis-
assembling is done.
Of course having a listing you can put that abdi.b instruction in.

>EasyRider didn't seem to have any problem here, although this clearly means
>losing those higher bits. I know the distinction between code and data (in
>the text segment) is one of those knacks a disassembler has to worry
>about.

The only thing that worried me is that TT-Digger could not be prompted
>(or forced) to turn the data into 'possible' code :-].

I will ask the maker to put somewhere a choice.

>Otherwise TT-Digger has proven very reliable and fast.
>
I will also tell him, he likes that.

Hello

Some words to said Dynamic Library are avaible on all Atari computer
they are name LDG.
For the moment there is one of this Library only! This library is the
port of MESA, the free port of OpenGL.

This library can be use for GCC and PureC. The mathematical software
Eureka from francois Le Coat use already it

That's right apart from the filename - TTDIGGER.LZH.

I think you must have hit a roadblock somewhere there, Mike, as I got
it down OK - and very nice it is, too :-)

The download URL was wrong. The HTML page states it as a ZIP file while it is a LZH file. The solution was to type in the path yourself and change the ZIP part to LZH.

Offhand I'm not sure but 32x32 would be a reasonable guess. However,
you might want to consider implementing something more generic: where
you enquire the iconified window size then centre the icon within it.
This allows (with clipping for safety plus a background fill in case
the icon is smaller) any icon size to be displayed.

>Thanks! That was exactly the problem.

It is unwise to do this. You could let yourself in for some subtle
bugs!

In technical terms ...
you have explicitly declared getche(). This, the compiler *must*
believe until evidence to the contrary comes to light. As no
definition for library functions exist this can only occur should a
conflicting declaration be met.

In english ...
find the header which contains the real prototype and #include that
file instead. Good rule of thumb: Never prototype a function yourself
unless it is for one you've written - even then it is best to put the
prototypes into their own headers.

setsndmode() is part of an library for the falcon030 and only
implemented
in this tos (with some other functions for the implemented
sound-features)!

it is an xbios-call, so if you like to call it from an asm-module try
this:

```
    move.w    #mode,-(sp)    ; mode: 0 = 8 Bit stereo, 1 = 16 Bit
stereo, 2 = 8 Bit mono
    move.w    #$84,-(sp)        ; function-index for this xbios-call
    trap    #14                       ; call the xbios
    addq.l    #4,sp                ; correct the stack
```

If you do not have some documentation of some functions try to use
your pure-debugger!

have fun
guenter

It has always been, and always will be (as far as I know), 32 pixels on
a side, just like MS Windows. Except most ST icons are black 'n' white..
:)
Some specialist operating systems or programs may have larger icons
(why? there's precious little space already!), and I know some have
colour. I just said that as, although I supposed that you were referring
to a program operating under normal GEM (such as faST basic with it's
icons), you might have gone custom.

Hello all!

Thanks for the advice and hints and such. I did manage to call
the number listed in his programms, and it is his
parent's number. They do not give out his number and just took
a message. At least we know he is alive and well!

Regards,

Jim

Hello,

Note that Mr Paul Finch (Portfolio Club U.K) E-mail address has
changed from pfinch@mettav.demon.co.uk,
To: paulfinch@x-stream.co.uk
The telephone number stays at +44 (0) 181-286-8990 (answermachine)

Please pass this information on to one other person.

Also:

WHAT HAS HAPPENED TO THE TAVERN BBS?

Can anyone help me with the above, which is a London (England, U.K) based BBS.

I was logging onto them approx once a week when suddenly the number just
started to ring and ring but does not log on to the BBS. Yes, all my computer
equipment does work as that is how I got here!

I have even wrote to Mr Paul Baker (the Syops) but no reply!

HELP, does anyone know what has happened to 'The Tavern BBS'?

Paul

Hello,

I have HiSoft Lattice C 5.52 for sale for 20ukp including p&p.

The package includes the following:

Original disks (in HiSoft disk wallet!), manuals and box.

The software comprises the Lattice C compiler, assembler and linker which can all be accessed transparently from the integrated development environment*, a complete set of libraries for writing GEM applications and the WERCS resource construction set. A single setup program installs all the different components into the right places on your hard drive - you can go from opening the box to compiling your first program in about 30 minutes.

The manuals comprise the library documentation for Lattice C 5, an addendum for Lattice C 5.5, a user guide to the editor and IDE and an installation and getting started guide which includes a quick tutorial. They are in good condition.

The box is, ehrmm box shaped - a bit like the type of box you would get a pair of Dr Martens shoes in, with a printed card sleeve describing Lattice C. The sleeve is a little sun light faded on one side.

I would prefer to sell in the UK as it is easier to sort out the money and the p&p is cheaper, but if you live elsewhere and can suggest a means of payment please get in touch.

That's all,

Michael

michael.clemmetsen%syntegra.bt.co.uk

* Note that the IDE does not work very well on the Falcon - if you have a Falcon I would recomend getting Lattice C 5.6 direct from HiSoft, since 5.6 includes Falcon support. However if you have an ST(e) then this is an ideal opportunity to get a complete development kit for the Atari. I bought Lattice C 5.52 when I had a Mega ST and am selling it now that I have moved to a Falcon.

Would some kind soul please help me with information about how to use APPL_READ and APPL_WRITE in assembler, my GEM books only describes them (very) briefly.

And can somebody tell me why TOS 2.06 returns two messages thru EVNT_MESAG when somebody presses the horizontal/vertical arrows? (It only occurs in TOS 2.06, I've tested 1.02, 1.62, 2.05, 2.06 with TOSbox/PaCifiST and 1.04 on an STfm.)

I do not have any example in assembler
but i include a small C example of sending messages.
It is the idea that counts.

You need to create a 16 bytes message buffert

```
     int mess[8];
```

Then you need to setup all positions
and set all unused to zero.

```
      /***************** the message ***************************/
      mess[0] = SH_WDRAW;              /** redraw desk window **/
      mess[1] = appl_id;               /** my id              **/
      mess[2] = 0;                     /** len                **/
      mess[3] = -1;                    /** all open desk windows **/
      mess[4] = 0;                     /** Zero               **/
      mess[5] = 0;                     /** Zero               **/
      mess[6] = 0;                     /** Zero               **/
      mess[7] = 0;                     /** Zero               **/
      /*************** send the message ************************/
      shel_write(7,0,0,mess,NULL);
```

In this example i have used shel_write
but the idea is that you create a message buffert
and then put the pointer to this into the shel_write/appl_write call.

Remember that it is not safe to have the buffert in temporary memory
temporary buffert at stack gives problems in a multitasking enviroment as the
buffert is lost
at exit of the function/subroutine.

And can be worked around be waiting for double clicks in evnt_multi(),
no matter whether you actually need them.

Ciao

Thomas

int16 appl_read(int16 ap_id, int16 length, int16 msbuf[])

Fill the arrays as follows ...

```
control[0]    =11
control[1]    =2
control[2]    =1
control[3]    =1
control[4]    =0

intin[0]  =ap_id
intin[1]  =length

addrin[0]=msgbuf
```

[make call]

Result returned in intout[0].

... appl_write is *exactly* the same except control[0]=12. Is that
enough info?

Hello,

I have HiSoft Lattice C 5.52 for sale for 20ukp including p&p.

The package includes the following:

Original disks (in HiSoft disk wallet!), manuals and box.

The software comprises the Lattice C compiler, assembler and linker which can all be accessed transparently from the integrated development environment*, a complete set of libraries for writing GEM applications and the WERCS resource construction set. A single setup program installs all the different components into the right places on your hard drive - you can go from opening the box to compiling your first program in about 30 minutes.

The manuals comprise the library documentation for Lattice C 5, an addendum for Lattice C 5.5, a user guide to the editor and IDE and an installation and getting started guide which includes a quick tutorial. They are in good condition.

The box is, ehrmm box shaped - a bit like the type of box you would get a pair of Dr Martens shoes in, with a printed card sleeve describing Lattice C. The sleeve is a little sun light faded on one side.

I would prefer to sell in the UK as it is easier to sort out the money and the p&p is cheaper, but if you live elsewhere and can suggest a means of payment please get in touch.

That's all,

Michael

michael.clemmetsen%syntegra.bt.co.uk

* Note that the IDE does not work very well on the Falcon - if you have a Falcon I would recomend getting Lattice C 5.6 direct from HiSoft, since 5.6 includes Falcon support. However if you have an ST(e) then this is an ideal opportunity to get a complete development kit for the Atari. I bought Lattice C 5.52 when I had a Mega ST and am selling it now that I have moved to a Falcon.

How do I detect and utilise a network within my programs? The only network that springs to mind is Mintnet, but I assume that there are more, and I've just forgotten about them.

For example, I am running on machine #3, which is currently heavily loaded, and running like MS Windows 4.1 (aka Win 98) on a 640k 386SX.

Is there some way I can find out what other machines are on the network, and send a piece of code to an under-utilised machine to be executed?

And, in a similar vein, is there some way I can send a message to/from my app on machine #3 to/from another copy of my app on machine #5?

I assume that there is a lot of overhead incurred in network protocols, and a few new concepts that I'll need to get my head around before this becomes feasible. Are there any decent "Networking your Atari" books I can refer to?

Hello,

What's the correct way to start a parallel process under a multitasking system like Magic. I thought the proper GEM call was shel_write(), but that only starts the process *after* the main program has quit. Oddly enough, Pexec(), with mode 100, works! But is it the proper way?

The STiK protocols come to mind.

Actually, there are numerous text books on this subject, usually
under the topic of "Distributed Operating Systems". Since true
multiprocessor systems is still in (relatively) early development,
there's not a lot of standards out there. In other words, on Atari,
you're pretty much on your own. Have fun!

For MagiC ...

```
shel_write(TRUE,TRUE,SHW_PARALLEL,exe,cmd)
```

... is the most commonly used.

```
#define  SHW_CHAIN 1    /* same as standard shel_write */
```

```
#define  SHW_PARALLEL  100  /* launch parallel process */
#define  SHW_SINGLE    101  /* SHW_CHAIN for "buggy" Gem apps */

char *exe,*cmd;
```

'exe' should the the fully qualified executable path/filename. 'cmd' is the command line which (iirc) can be passed NULL.

Example:

```
shel_write(1,1,100,"c:\\apps\\everest.prg",0L);
```

Offhand, I can't remember exactly the first two arguments. One of them is 'isgem', which if set FALSE will invoke a 'dos' application. The net effect of this is the program should end up running in the VT52 window. The remaining argument escapes me atm.

Note: for what it is worth, it is possible to launch a singletasking process and from that process, spawn parallel ones. I found this by accident from my command shell one day.

One of the problems with Pexec() is that it (obviously) bypasses the AES somewhat. Thus, should a child process ask the AES about its path it'll be given the information from the most recent parent Gem "spawn", not its own path. This can play havoc with its datafiles (not found, ending up being created in wierd places, etc) - this also applies to its resource so is usually fatal.

Most people can get away with this simply by coding thus ...

```
rsrc_load("foo.rsc")
```

... but this is not recommended. If the user changes the 'dos' path away from that of the executable then the resource will not be located. Again, as always, the solution is to use fully qualified filenames - ie build the path from the information returned by the AES.

There's a caveat. [Isn't there always?] ...

Standard Gem returns differing information for the aes path depending on the version. There was even an instance where I found this changed due to the hard disk driver in use! In many cases standard gem returns information which is useless. It is therefore advisable to parse/test the information returned. If it is nonsense then enquire the dos path and use that instead. Standard gem typically returns information like this for (say) c:\apps\bob\foo.prg ...

```
C:FOO.PRG
C:\FOO.PRG
FOO.PRG
[]
```

I can't elaborate further. Unfortunately I archived all my Atari stuff
with lzh and didn't realise a password was set. :-((

Hi Folks,

I somehow managed to archive all my Atari stuff with LZH shell without
realising there was a password set. I've absolutely no idea what that
password was! :-(((

I had a look at LHarc from the command line. Even worse news: it
appears to return zero status whether it succeeds or fails with "bad
table". Therefore, I can't even try a brute force approach. I had
hoped this would succeed. I never use passwords so in likelyhood
whatever it was would have been very short, therefore the brute force
approach (try one key then the next) might have worked.

The only thing which isn't "lost" is Pug (archived again separately)
but the subsystem (stuff added to my compiler object library) upon
which it relies is in the archive with the password [substitute very
many 4 letter words here].

So ... does anyone know how to solve this dilemma, either with an
Atari or a PC program?

It does, but only if it is a program with extension .prg or .app.
MagiC refuses to run .tos and .ttp programs with shel_write.

>processes, namely reporting the file is already opened, or as seperate
>occurances.

I do not know if you ment file handle #48 or the filename #48
but if you are using the same file in more than one process
maybe you need to sync the read/write with a semaphore.
You need to open the file in a new process to get a new filehandle.

> As I have mulitple iterations of the same process on terminals, these
>processes of course treat files in exactly the same manner.
> Also when a file is opened, is time sharing stopped until the file is
>closed.

The time sharing is working when a file is open.

> I occasionally have a program quit when 2 terminals try to access the
>same file a the same time.
> This problem only occurs on rare occasions, about 4 times in over 1000
>hours of running.
>Any suggestions that will help clarify this would be appreciated.

Go and get the new Freemint 1.15 as this has faster filesystem.

Best Regards
Erik Hall

Yes, yes, I've discovered that. But ... suppose I just want to view
the disassembly starting at (for instance) address $0AB82 (LOAB82)
when I do not have a reference to this address on screen?

If you have problems with pure-c, you can have a try with assemble.
This assembler produce a code compatible with "plink.ttp". Moreover
you can use "make" with it, even if you are in single task mode (with
or without mint).

I have for sale:
1. HiSoft Devpac 3 (68xxx assembler)
2. HiSoft Basic v2
3. HiSoft C (interpreter version)
4. Lattice C v5
Will anyone give me a sensible offer for them?
Replies by email please.

I've been using the MagiC task manager to do just that - terminate the
launched processed, but I haven't tried doing something in MagixDesk to get
Lattice back. Like you say it is missing from the list of active programs.
I'll give your tip a try.

Thanks,

Michael

Greetings Atarians!

Today I'll bother you all with yet another stupid question! 8)
How can I find out if a window is iconified or not?
Do I have to keep track of such things inside my program?

Thnx,

Joakim

The files are opened by each process individually. The processes
just use the same Identifier internally. #48 is the file Number used
to access a specific file. This is GFA Basic code. Assign a file Number
to a file when opened and accessed.

This term is UNIX.
Semaphores is like a global "lock variable" but it can be used by all
processes that knows the name.
To use it there is a system call in mint called Psemaphore()
this can be used for many things but in your case it can be used
when you writes to the file and lock other processes from reading/writing
and the prevent them to get false or corrupt data.
As mint is preemptive multitasking you can get strange result if two processes are
accessing the same file.

More about semaphores can you read in the book "The Atari Compendium"

NEWSie is programmed in Lattice C. Wdialog was developed w/Pure C.
Lattice "wants" to use Address Register 4 (a4) for a Global Data
pointer.

The Wdialog specs specify on the service-routine:
"The routine may use registers d0-d2/a0-a2."

With the version of Wdialog built-in to Magic 5.03, NEWSie has no
problems using a4 (via the __saveds function). With Wdialog 2.0+,
there is a distinct BOMB when NEWSie tries to Edit Nicknames.

What can be done? I have tried saving and restoring a4 before
returning from the service-routine. It still works on the Magic
version and still bombs on the Wdialog 2.0+ version.

It may not be a4 after all, but that is all I can thing of.

I also get "Invalid Handle = n" messages with Wdialog 2. What does
this mean?

So me questions arouse about the FIND use in the disassember TT DIGGER
I translated a small piece of the manual:

Find

.. Address... (A)

Goto this address

.. HEX code... (H)

Search for a combination of bytes (in hexa)

.. TEXT... (T)

Search for a ASCII-tekst.

.. Reference... (R) of (V)

Search for a 'relative' reference
This is for finding fast the place where a label or address is used
In hexa
Label should be typed with or without pre- R T U or X
Searching starts at current position (default)

 Realative references (type Bcc, DBcc, dd(PC), d(PC,Rn)) are
     put in the first sentence in the window

When searching relocatable PRG-file (.PRG .TOS .TTP .ACC .APP .O)
only relative en relocatable adressen are found In other cases also
  absolute adresses.

Hello,

- new list of CENTurbo II compatibility softs. Thanks for user
to send me your test.

- new versions of CENTscreen (3.3.1) and VIDEOMODE (1.1.0)
on the site. The goal of this version is to correct a bug with nvdi
which didn't change resolution if the boot and the desktop have
the same colour depth.

- the PATCHCT2.ZIP (on CENTURBO II page) contain a modify
SCC.PRG (HSMODEM) to run correctly on CT2. The original
think that SCC is on 14MHz master clock instead of 8MHz.

Just tried TT-Digger on a larger program and it's really good. It's fast and more reliable than EasyRider (especially in HiRez), which I used before. And it runs smoothly on my PC-based Atari emulator.

There is, however, one problem I came across: It refused to disassemble the directive

```
                andi.b        #5,-22(a5)
```
regardless whichever way I tried. All it produced was a DC-sequence.
Converting between code and various data-formats (b, w, l) didn't work.
Maybe I missed something in the manual (my Dutch is only rudimentary).

Oh yes, that 'FIND'-thing again...:
As there seems to be some problem or other with accessing the
FIND-functions, here is my contribution:
How do I look for opcodes? For example, searching for 'dc' to locate
disassembling problems (EasyRider has a special function 'Find next data
position' for this).

Greetings

Rainer

User-interface is a little unusual, but I think we can access it..

Well, I've been gem and magic programming for years and I currently use
lattice c (not c++) , Asm (for the fast routines) and (mostly) Hisoft basic.

Both lattice and basic come with pretty full libs to use system functions although the docs are sparce so try and get hold of something like the Atari Compendium which, with all it's errors, is stil the best I've found. The asm has very few libs but then really u don't use many in Asm anyhow.

As far as graphics etc. these are a combination of system commands (windows, menus, etc.) and a resource file (the .rcs file extension). Lattice and Basic come with a program called WERCS but it is pretty dated and doesn't like magic or Mtos. I use Resource Master (v2) which is shareware and Interface (comercial). Both of these support the magic enhancements and things like colour icons. Also, they both save the header files (that hold all the names u have given to the objects) in multiple language formats. These are both point and click based but NO code is added to objects (unlike in visual basic for instance). The rsc file is loaded in to u're program using system commands and the items are drawn on screen when and where u say.

I must warn u it takes a lot of patence (esp. when teaching u'reself) to program gem but I'm sure u'll get loads of help from the likes of these newsgroups :)

May I suggest first that u get something better than WERCS ? Something

like resource master.

Basically, in theory, ignoring the limitations, any object tree could be a menu - u just have to tell the system that the object tree is a menu using one of the AES menu commands (don't have the referece books handy - sorry). However, the AES really doesn't like it if u try and draw some things in a menu bar so the safest is to limit u'reself to the objects u listed above. Also, the same menu command allows u to shange the menu bar at any time during the program and a similar construction to a popup menu object tree can be used for submenu's which are attatched using other aes menu commands - everything is listed in the Compendium and a number of other books.

Resource Master and Interface both allow u to change the type of an object back and forth between menu and dialog - as long as it contains no illegal menu items. This means u can change the bg colour of menu's, make them 3d etc. The only probs with this is redraws don't work quite right on some aes versions.

This is pretty normal - I think Lattice does the same. Basically don't ever expect any routines (esp. in asm) that have stuff in these registers to have the same contents after calling a system or general c/c++ function.

>
>
> What can be done? I have tried saving and restoring a4 before

Sounds like it's not the a4 stuff then. Anyhow, 1) u can change the a4 usage in Lattice (but then it doesn't garentee compatability with the libs) and 2) lattice should take care of all that lot anyhow (there are asm instructions to do all that for u).

> I also get "Invalid Handle = n" messages with Wdialog 2.

What is the handle for ? Window, file or what ? The most common prob is u've passed a pointer to the handle where it expects just the number or vice versa and it is (in the first case) getting a large number of a memory address instead of say a simple int value like 1 or 17 or something for the window handle :(

Check the handle variables and make sure the right stuff is being sent to the functions.

Yes. It's quick, isn't it! I have been using it quite a lot over the last 2 days and am getting used to it. I have had to learn a whole new series of operations as I am so used to Easyrider.

>Oh yes, that 'FIND'-thing again...:

>As there seems to be some problem or other with accessing the

>position' for this).

Yes. I don't think there is an equivalent to this. When I have needed
to find an opcode I have just used the Find hex function. So, looking
for move.w <imm> d0 I have done a hex find for 303C.

Easyrider was giving me increasing problems so I shall try to learn
how to use tt-Digger effectively.

Greetings atarians!

Now I have a new stupid question for you all.. 8)
Do installed and active applications (as ST-GUIDE, COPS, etc) send any
data to message buffer that can confuse other running progs?

The reason that I ask this, is because I am experiencing some trouble
with my GFA-GEM routines, but problems _ONLY_ occur when it comes to
co-existing with *ACC:s. It could of course be a bug in my code, but it
seems as if an already occupied handle is supplied for the ACC. Any
idees..?

Thanks in advance,

Joakim

This is a good program. I used it to give me a disassembly
of the BJL modified ROM for the Jaguar and it did a good
job.

But, I wanted to be able to have a listing with both
to hex codes and the disassembled listing. I don't read
German very well, is there another program that has
english pull down menus?

Also, is there someone out there who can give me the
low-down on the idea and simple layout of what a
Transputer is? I remember Atari working on making these
type of computers, but I never paid any attention to
them back then. I'm curious about what it was.

Yes your program can receive messages from other applications and ACCs
If your program don't understand the message received just don't care about it.

If you give options: hex/asc + opcodes + labes + symbols

and do a 'save as...'

then you have everything.
Or not?

For the rest: the manual is in Dutch, you can say a kind of dialect
from German spoken bij 13 million people.
We even have a writer with a literary Nobel-Prize :-)
But I believe that was before my time...

I have found the reason for the trouble with searching and finding.

THERE IS A BUG!

Normally you can count adresses decimal. Why do it hexadec?
Only because some stupid assemblers expect in de instruction code all
numbers automatically to be in hex?

When you do decimal representation the 'FIND' goes well.

GOOD NEWS:
The maker expects to have a real manual in English within a few days.
Then the rest of the world outside Holland can wallow in comfort with
TT-Digger.

Other news:
 the 'bug' of the andi. is no bug but a feature. Because of the
 construction of the instruction.
 Motorola manual says:
 -
 This instruction is used to AND the immediate data present in the
 "succeeding program memory locations" to the destination operand.
 -

The problem with find is: use for the moment the 'decimal'

representation. Talking the the auteur resulted in 'a bug, that will
be repaired'. Somewhere in the internal conversion the hexa notation
screws up.

If all is well, he has contacted you by e-mail. But for the rest of
the world:
the #5 works with an logical AND on the data in the succeeding memory
location. That location is not part of the instruction. Because
instructions are aligned on even adresses, from the following 16 bits
only 8 (the .b) are used.

Hello,

- new list of CENTurbo II compatibility softs. Thanks for user
to send me your test.

- the PATCHCT2.ZIP (on CENTURBO II page) contain
  Falct2_8.prg to run under turbo mode. It's the new version
of Falcon8.prg, the patch for calamus in 256-color mode.

- the soft to update the flash is in ct2_soft.htm (via centurbo.htm)
with the last version of Flash.bin.

- the last version of CENTview is available: 1.7.2

EUROPEAN PROGRAMMERS REQUIRED FOR WORK IN UK
****

AN AMAZING OPPORTUNITY IN THE UK

IF YOU CAN PROGRAM IN VISUAL BASIC
OR ARE PROFICIENT IN MS ACCESS
AND IF YOU ARE FAMILIAR WITH LOTUS NOTES

.....WE NEED YOU !!

ARIA TECHNOLGY ARE LOOKING FOR PROGRAMMERS
AND DEVELOPERS TO HELP US EXPAND OUR HARDWARE,
INSTALLATION AND SUPPORT BUSINESS. WE ARE ALREADY
ONE OF THE UK'S MOST FAMOUS PC HARDWARE SUPPLIERS
AND WE NOW NEED PEOPLE LIKE YOU TO FURTHER OUR
BUSINESS AND OF COURSE YOUR FINANCES !!

YOU CAN WORK AND DEVELOP VIA THE INTERNET WE HAVE
WORK WAITING FOR YOU !!
IF YOU NEED TO CHECK OUR INTEGRITY, HONESTY

CALL, FAX, E-MAIL
FOR FURTHER DETAILS

First I'd like to make clear that this is not in any way meant as criticism of TT-Digger. From my tests so far, it seems to be a really good program. Still, if there are bugs it would be nice to get rid of them.

It's not a directive, but that's of course beside the point.

```
>>                andi.b        #5,-22(a5)
>>regardless whichever way I tried. All it produced was a DC-sequence.
```
...
>the #5 works with an logical AND on the data in the succeeding memory
>location. That location is not part of the instruction. Because

Someone must be misunderstanding something here (could be me, but I doubt it). 'andi.b #5,-22(a5)' is clearly a correct instruction and should of course be disassembled properly.
Both the number and the effective address specification are part of the instruction, only they're in extension words rather than the opcode itself.

From another message:
  Motorola manual says:
  -
  This instruction is used to AND the immediate data present in the
  "succeeding program memory locations" to the destination operand.

This simply means that the '5' is located in a word following the actual opcode, like in just about any instruction with immediate data. There's no difference between this and a 'move.b #5,-22(a5)' for example or even 'move.b #5,d0'.

>instructions are aligned on even adresses, from the following 16 bits
>only 8 (the .b) are used.

How is this relevant to the supposed bug?

All gcc versions can 'easily' be built as cross compilers. I've done
this several times myself on the Mac and Sun I use at work.

Note that this only gives you the C/C++ to assembly part.
The GNU assembler can of course also be cross-compiled, but I've never
tried that. Then there's the problem of finding a linker that can output
a standard Atari .PRG file.
Still, the actual compilation is what takes the vast majority of the time
and you'll have to transfer some files to your Atari (or perhaps emulator)
sometime anyway.

If you don't want to rebuild everything yourself, you'll of course have
to look around on the net for something pre-built. I have a DOS-based
68k gcc/g++ at home, but I can't remember where I found it.
Check out the homepages of some commercial GCC support company
(there is at least one, but I can't remember their name.

You have to use the Atari as/ld (the current BFD-based binutils do not
support TOS .PRG binaries). I am told that this will work fine - Frank
Naumann (MiNT kernel maintainer) just did this ...

Myself, I am using a modified gcc/egcs built as a cross-compiler for
m68k-unknown-coff (using the current binutils) to compile the current Milan

TOS on a PC.

In every case, you probably habe to compile your cross-compiler on your own. On a Unix system, this will be relatively straightforward (if you read the crocc-gcc FAQ), in w Windows/cygwin environment, it might be a bit more tricky, but I have heard reports on the cross-gcc mailing list that it does work.

From the author:
>
I immediately remembered this.
The following is the case:
because it is a byte size operand, the immadiate value must be put
in bits 7 to 0 of the following 16 bits word.(least significant byte.
Now if there are bits set in the most significant byte I have to make
 a choice: If I disassemble the instruction I can not both produce a
 valid instruction and show you those bits. Although the processor
 ignores these bits. TT-Digger is primaraly a diagnostic tool.

Henk Robbers.
 If this is not the case I gladly hear from you.

A new version of TT-Digger is available with the FIND working good (I
hope).
 Download of new version (I only live 24 hours a day) will be
 possible end next week.

 For the rest: maybe this weekend all ready a ENGLISH MANUAL!!!!

Subject: Help with Wolfenstien 3D STe conversion
Date: 1998/10/24
Message-ID: <3631db76.4699163@news.easynet.co.uk>#1/1
X-Deja-AN: 404641481
Organization: [posted via] Easynet UK
Reply-To: martin.w6@ukonline.co.uk
Newsgroups: comp.sys.atari.programmer

I've got a friend whose keen to do a Wolfenstein 3D
conversion to the STe now that he's learned assembler.

I wondered if anyone out there has any faqs, C source or
knows if this project was ever started elsewhere so he could
pick up the pieces.

Also what do people think, is it possible?

Personally I think the STe could pull off reasonably well.
The STes enhanced features while not amazing should make
some difference to speed especially with sample playing.

Wolfenstein 3D works on a 286 PC with 640k base memory and I
think about 256k expanded memory.

At the moment he's working on a basic 3D engine so he can
understand perspective.

It will probably get released first as a simple graphic demo
and then possibly a simple deathmatch game when connected to
another STe before becoming the full game.

It will probably make use of its one custome sprites but use
wolfenstein level data ripped out using a supplied util

I.e. you can play the levels but no new wall testuxes or creatures.

This is because of the 16 colour limitation and any attempts to improve on this would slow the game down. Attempting to dither or simply ignore extra colours would not be feasible.

Its more than likely that the game play area will be derezed slightly with a small border although accelerated models will obviously be able to avoid this.

The PC version has an effective playsing screen of about 300x160 approx with maximum border about 100x53.

The ST version will probably have a resolution of 120x80 but be doubled both vertically and horizontally to give 240x160. I.e. every 2x2 pixels are the same.

It might look blocky but will at least be playably fast.

The status bar will look much the same as any Wolfenstein and the gun will probably be pasted just below the playing screen i.e. not protruding into the main action screen.

Its not expected that wolfenstein music files will be utiliised.

Personally I think if he can pull it off it will be the best ST game ever because Wolfenstein is so playable.

Whle it may not compare to more sophisticaed versions the death match facility will be exclusive to the ST version.

The final engine will probaly retail at £4-6 for shareware registration but no more than this. Which should offset some costs without actually being profiteering.

This is a serious project which I hope will stay on course to the end.

At this point I'm trying to collect as much information as possible about Woflenstein. Please don't attach anything to emails without a plain email first telling me what you have.

Please don't reply with any 'can't be done' type letters it obviously can be. In fact Substation is a more impressive engine (its just a not very playable game). The question is will it be ok speed or a decent speed.

I write currently driver for IDE hard disks for Atari (ST) machines. I want also including option for work with PC (MS DOS) format hard disks. I made simple routine which swaps High/Low bytes in word, and it worked very fine with PC disk. But for now only with 'normal' or Non-Bigdos partitions under 32 MB. Of course I want writing routines for work with larger partitions, up to 2 GB - nobody uses still such small partitions. It should work with program BigDos.

I think that it will be useful, since most of PC-s are equipped with IDE drives. Btw. what is by SCSI drives ? Is High/Low byte order reversed also ? Sadly I don't have SCSI interface on ST to check it.

Well, what I need is some help about writing that BigDos capable driver. I suppose that extended Bios function Rwabs contains additional 16 bit data of starting sector of block. I saw also some additional fields in GetBPB function, or it is new-extended function ?

So, if anybody could, please send me infos about these. I write driver in 100% assembler, and I don't know programming in C.

It would be best if you send me how put parameters on stack by function call - like in Atari (ST) Profibuch.

Also some infos about XHDI 1.2 will welcome. Some link, literature, anything.

Pera Putnik

I don't think you can. I believe Linux requires a 68030 processor (at
least) to deal with the memory management.

I may be wrong!

You cannot. Linux and NetBSD require at least a TT or a Falcon.

Your best bet is to install MiNTos, using the KGMD package or
the english version KEMD_R2. See http://kellis.atari.org for
more info about it.

The released version of 68K linux requires a 68030 and an FPU. The STE
has neither of these.

It appears there might be a version compiled for a 68000, but I don't
know where.

You might rather go for MiNT, which is very Unix-like, but also TOS
compatible. There are many unix utilities that have been ported to MiNT.

Cheers,
Nick

There is Linux for the Atart ST - but it's not yet complete. You can
check out it's progress at:

http://www.esat.kuleuven.ac.be/~pcoene/index.html

Ofcourse it can be done...
Just at what speed..
And substation doesnt really do texture mapping does it ?

Just some doubts i have about this working on ST well.
esp. after some experiments on the falcon.
And that comment you made about 'now that he's learned assembler'.
I dont wanna sound arrogant or anything, it just doesnt sound to hopefull to me.

Anyway, just my thoughts on this.
Feel free to mail if u like to have Wolf3D sources.
I must still have em somehwere.

> [snip...]

I see, so the problem was some bit-dirt in the most-significant byte. I don't know what assembler/compiler was used for the original programm I disassembled (some C-compiler, I guess) because this occurred in all instances of above instruction.
EasyRider didn't seem to have any problem here, although this clearly means losing those higher bits. I know the distinction between code and data (in the text segment) is one of those knacks a disassembler has to worry about.The only thing that worried me is that TT-Digger could not be prompted (or forced) to turn the data into 'possible' code :-].
Otherwise TT-Digger has proven very reliable and fast.

Greetings Atarians!

It is once again time for me to ask stupid questions.

What size should an icon (for iconified windows) have?

Thanks in advance,

Joakim

NNTP-Posting-Date: Wed, 28 Oct 1998 17:41:28 EDT
Newsgroups: comp.sys.atari.programmer

I've just started to explore Sozobon and I've come up with this
problem involving getche():

```
#include <stdio.h>
void main()
{
     char ch;
     printf ("Press the ~ key to stop\n");
     for(;;)
     {
          ch==getche();
          if(ch=='~')
          {
               break;
          }
     }
     printf("\nDone!\n");
}
```

When I compile this with -lextra I get a warning from hcc - "implicit
decl of getche".

When I run the compiled program the characters echo to the screen as
expected but hitting ~ has no effect.

What is the warning from hcc about?

Hi again,

So does this mean that Lattice 5.60 *does* work with a Falcon or not?

Does anyone know what the major differences are between 5.52 and 5.60?

Thanks,

Michael

Yes, I discovered that shortly after I posted that last article. Is
(*next) always NULL, even if there is another NDB waiting?

> You know this is the sort of action CNget_NDB is intended to avoid, for speed
> reasons. What you do here is exactly what does CNget_block() internally. Sure
> it's ok for testing, but for efficiency you should do the processing 'in place'
> i.e. without copying to a buffer; otherwise the use of CNget_NDB() is pointless.

Yes, as you say, it's just for testing. In the game I will have no use
for printing the blocks, since it's always some kind of message from
another player's computer. I don't mean text messages readable for
humans, but rather messages used for for example position updates and
collision detect and so on.

> >   5. check the last pointer (*next) to see if there is another NDB
to
> > process. If zero, goto 7.
>

> Do not do this. Simply omit this step. There is never 'another NDB' as linked
> to this NDB via the 'next' entry.
>
> >   6. KRfree both the data pointed to by the NDB (*ndata) and the
NDB
> > itself. Goto 3.
>
> This must be done regardless of the 'next' entry. Replace the "Goto 3" by
> "Goto 1"

Well, now I've fixed it so it works. Now the pseudo-algorithm is like
this:

1. call CNget_NDB() with the handle
2. if d0=0, then no blocks to read, quit
3. get address to the data (*ndata) and the length (len) by using d0 as
address to the NDB
4. print the data
5. if (*next) is NULL, there are no more NDB's: quit, otherwise goto 1.

Can I rely on (*next) indicating wether there are any more NDB's (but
not use it as a pointer), or should I just skip that step and goto 1,
directly after 4 without checking (*next)?

Regards
Henrik Gild

I remember reading somewhere (HS-modem docs, maybe?) that it is
possible to drive the ST Modem port at 38400 by simply changing
some clocking variables for the MFP (and the baudrate registers
so that this speed is reported as available).

This implies that NO hardware modification is needed.

Does anyone recall reading this and where, or otherwise knows
how to do this? Thanks.

Greetings,
The first version of the Free Pascal compiler for 680x0 targets is now available on most Free Pascal official sites. Currently available are:

- Cross development environment for AmigaOS on linux-i386
- Cross compiler for Atari TOS on MS-DOS
- Native AmigaOS Free Pascal compiler

These compilers are based on Free Pascal 0.99.5c, this revision has not been released for the x86 but is similar in effect to Free Pascal version 0.99.5 except that all known code generation bugs known from FPC 0.99.5 have been fixed.

You can get the compilers at:
ftp://tflily.fys.kuleuven.ac.be/pub/fpc/dist/

Help is required to port to other 680x0 operating systems:
- Atari native TOS port
- Linux-m68k native port
- Macintosh port help

Please if you can help, contact me via *e-mail*, i would do this port myself, but i do not have access to these operating systems.

Sounds good but I have never heard of this. I always believed you had
to use a 4040 chip to do it.

I know it's difficult to explain - I've been through it myself with
Pug!

Pug uses a philosophy that the cursor should always be off and only
turned on when absolutely necessary, rather than the more obvious idea
that the cursor should be 'mainly' on. It keeps track of the cursor
status info for each window it is handling and just about every
message results in the cursor being turned off. If memory serves, the
only place it can possibly get turned back on again is in the code
just after walking the redraw rectangles, provided the window had a
cursor status of 'on' and the window is the top one.

Tbh, if I'd known back then the trouble the cursor was going to cause
me I'd have written my own code for it: I suggest you do exactly that,
especially if you want multiple cursors, background cursors, or
scrolling edit fields. It'll be much easier in the long run!

>I do not really understand this, partially because information is missing
>(like the AND and XOR masks),

That idea was pinched from the Acorn BBC computer operating system calls. By selecting appropriate values for AND or XOR you can selectively read and/or write bitflags. It went very much (if not exactly) like this:

```
SOME_OS_CALL:
current_bitflag -> copy
current_bitflag &= ANDV
current_bitflag ^= XORV
return copy
```

Thus, a simple read would be
oldval = SOME_OS_CALL(0xff,0x00)

Setting bit 0 would be
oldval = SOME_OS_CALL(0xfe,0x01)

and so on.

>but to me, "written back to the interrupt
>mask" and "can be called from user ... state" is a contradiction.
>
>What's the goal of this bit ?

The idea is that the interrupt flags can be interrogated or altered from userstate or superstate, as cp_irq shifts state accordingly. I've never had a reason to use the call (it got implemented for completeness) and have never tested it either. Therefore I just wondered if it would actually work.

```
/* set level to 7, return old level */
oldval = cp_irq(0x0000,0x0007)

/* do something */

/* restore level */
cp_irq(0x0000,oldval)
```

I can't remember / don't know exactly what you asked but ...

You don't have to draw the object on the screen: the object gets
written to the logical screen base. It just so happens the physical
screen base is usually the same. There's nothing stopping you
allocating memory for a "shadow" screen and setting the logical screen
base to that instead. However, when you do this you affect
everything - not just your own program so the answer is still "no".

What you could do, is write a little utility to draw your object
tree(s in turn) on the screen, blit to memory using the vdi and dump
it into a file. Your program proper could subsequently load the image
and blit it back on screen as required. You'll have to deal with
resolution problems etc yourself though.

If you know how to do the trailing star there is no problem:
use the method but wil aal counters going the other direction
or
make the strings backwards->forwards

>how to do this? Thanks.

Yes, Erno Meffert did it.
Trick:
remove connection of Timer_D output to the reciever and transmitter
clocks
so disable connection pin 16 to 7+10 of MFP

Next step:
take clock of pin 18 MFP and divide by 4 with an 4040 chip.
Resulting clock into 7+10 pins
Let this signal be divided by 16 in de USART part of the MFP.
So you get 38400 kb.

Possibly I'm missing something obvious, but all I know about menus is

that they are object trees that contain objects of type G_TITLE (for
titles:-)), and G_STRING (for the drop-down menus, but I use them for
captions in ordinary dialogs as well) and a few G_IBOXES and G_BOXES.
However, if you load a resource into Wercs without a hrd file, it
correctly displays the menus; does it just run down the options, or is
there an easy way?
Alternatively, does anyone know where I can get source for a resource
editor. I'm trying to write one for the PC, and menus are the biggest,
but not the only, puzzle.

There should be no problem getting Lattice 5.5 to work on a Falcon.
Under MagiC you must run XMEN_MGR.PRG to get access to the options
menus.

There are other reasons. This won't work with external graphics hardware, i.e. graphics cards etc., as they usually bring their own VDI which doesn't necessarily use the concept of a logical screen base.

You'd be better off telling us what you intend this for, there are probably better ways than drawing the tree in hidden mode.

> What you could do, is write a little utility to draw your object

It's not only that. Different AESs will draw the tree slightly differently, so again portability is lost.

Cheers Peter

The only difference between a normal object tree and a menu is the
menu is less flexible in its components, and they must be arranged in
a certain way. Unfortunately I do not have the specifics at hand.

>However, if you load a resource into Wercs without a hrd file, it

AHHH! Finally! My newsfeed is back up...
OK, so I'll immediately start with posting a question :-)

Does anyone know what the MFP interrupt priority order is?
Is interrupt line 0 (BUSY) highest or lowest priority?
Thanks,
     -=Levien

The correct order AFAIK is (Starting with the highest priority):

```
IERA 7 Monochrome detect
     6 RS232 Ring indicator
     5 Timer A
     4 RS232 Recieve buffer full
     3 RS232 Recieve error
     2 RS232 Sender buffer empty
     1 RS232 Sender error
     0 Timer B/Hblank

IERB 7 FDC/HDC
     6 Keyboard/MIDI ACIA
```

```
     5 Timer C
     4 Timer D
     3 Blitterchip ready?
     2 RS232 Clear To Send
     1 RS232 Data Carrier Detect
     0 Centronics busy

> Thanks,
>         -=Levien
```

You're welcome.

While we still are talking about the MFP, is there anyone who knows if these are the correct bitdescriptions for GPIP and AER?

```
GPIP/AER 7 Monochrome detect
         6 RS232 Ring indicator
         5 FDC/HDC busy
         4 Keyboard/MIDI ACIA IRQ ???
         3 Blitterchip ready ???
         2 RS232 Clear To Send
         1 RS232 Data Carrier Detect
         0 Centronics busy
```

>be able to use GEM functions. In other words be able to put a nice GEM
>front end on my programs.

In fact there's a solution, I have do a program witch generate C for GEM,
very easy to do utilitys programs with GEM. It work only with GCC, but
the problem is the installation a little bit hard, without
good documentation and it's in french, so if you speek french it's
avaible if you want.

regards
Olivier

Hello again,

Following Terry's advice I checked to see if XMEN_MGR.PRG was running and it
was, however I then discovered that if you do *not* run XMEN_MGR then the
cascading menus in Lattice C 5.52 do work under Magic 5.11.

However it is still not possible to launch a GEM program from within the IDE
without putting Lattice C in limbo (the only way to get it back is a
reboot). But at least this means I can start programming and switch to
Magxdesk to launch programs. Once I get more proficient in C I may consider
the upgrade to 5.60, but I don't think it is worth it for compiling "Hello
World".

Hi!

I'm looking for a newer version of Micro C for the Falcon-DSP. Mine is
already some years old and quite buggy. Does anyone know if this was
developed any further and where I could get it?
If not, some idea where I can get the original portable source code?

Thanks, Michael.

According to atari ProfiBuch:
in case of an ST MFP only (TT is somewhere different with 2 MFP's)
highest channel nomber and priority has I?o port 7 (I7) monochrome
detect

lowest (0) has I/O port 0 (I0) BuSY of par.port.
In Atari ST Ram the adres of the interrupt auto vector for the
normally not enabled MFP int. nr. 0 is $100.

Checked them with Atari Profibuch:
On adres $FF FA01 is "GPIP"
bit 1,2 and 6: used for serial handshaking
4 for ACIA both, "who did it?" by checking ACAI statusregisters
5 indeed floppy controole ready after command execution
Alternatively: ready transport on DMA-harddisk port
nr 3 from blitter chip; the GPU-Done

I'm currently trying to mix assembly language and C in a project
with Pure C 1.1 on a falcon. It works fine with small programs, but
it generates bus errors with bigger ones (.prg file > 80 Ko)
it's probably a specific option to use during the compilation but I
can't find it.
Does anyone encountered the same problem ?

Thanks.

Menus also have a certain structure, so it's quite save to guess wether an
object is a menu or not.

> Alternatively, does anyone know where I can get source for a resource

Do you know about ORCS? It`s a shareware resource-editor. There are
versions available for Windows and Windows NT. They still use the GEM RSC
file-format however, so there is currently no way to convert them to
RC-files, if that is what you are trying.

If you need an intelligent interactive dis-assembler
that can use all 680xx CPU-codes
that makes labels
that can use debug-tables, relocation tables, symbol tables
that generates listings compatible to most assemblers
(directives, syntax etc)

That use TT-DIGGER

Now for free download on

http://www.xs4all.nl/~atarist

it is the endproduct of 10 years of development.
As far as we know from hundred of users: bugfree.

Sick. Ring indicator has priority over Timer A. Oh well, it's just the
communication decade(s), I guess... Everything has to stop for incoming
telephone calls :-)
Anyway, so line 0 has lowest priority then... Thanks.

Looks about right... You can check the Atari hardware register listing
if you want to be sure... (hardware.txt, usually, or try my site)
Thanks,

Whoops! Found it! It looks good. I wonder why the TTDIGGER archive, which has a .DOC about v4, contains the Screen Worms programs :-)

The manual is may be not very clear but correcting the assumptions
the dis-assembler makes is easy.
Say: in the middle of some valid code there is data.
Wrongly that can be taken as (mostly non-sense) code.
Put your mouse-pointer on the offending mistake and press 'B'-key.
Then it is displayed as (byte) data (or use W or L).

The same way around:
when code is wrongly taken for data use 'C' to interactively put your
own intelligence to work!.
Also pseudo-labels that are wrongly generated disappear.

Yes. It's a shame that the HYP is only available in Dutch! I wonder
whether it has ever been translated.

Anyway .. it's a nice piece of work and I'm going to be fascinated to
find out how to use it well.

Hi Michael,

> So does this mean that Lattice 5.60 *does* work with a Falcon or not?

Yes.

> Does anyone know what the major differences are between 5.52 and
> 5.60?

5.6 Enhancements:

* MiNT/MultiTOS memory protection flag is now variable.

* Mon now works on Falcon with special enhancements.

* Compiler now supplied in .TTP format too.

* m0 and m1 are the start and end address of a binary file, m8 and m9 are spare.

* Mon has Widen Window command.

* Mon now has Start at Label feature.

* Tools: make, ar, dr21c, lprof and lstat are now included.

* Manuals are no longer ringbound. (Is that supposed to be an enhancement?)

That's everything on my list.

John.

abother thing nice to know:
when you have given 'labels' generation you will find code statements
containing adresssen 'by label-name' Click on the labelname in the
code and your cursor is placed whre that label is placed.
Go back to where you came from with 'undo'.

>Previously I have used Easyrider v4 but this has been giving some

It should not be a problem. The maker knows that things like TOS blow
up in ascii-tekst assembler listing as 2.7 Mb.
The biggest I know that was done was 1.4 Mb program code.

If you are using PC-relative code (like lea $20(pc), a0) this may happen.
Of course, you should also get a linker error in this case. You should
make sure you do not have warnings turned off.

I am looking for any compilers that can be run in DOS/Windows on Pentium
that can cross compile into 6800 for the Atari?
Anything Object Oriented ?
I notice that Visual C++ 5 can compile for MAC platform anyone tried getting

it do simple stuff for the ATARI.?

Yes, I've just found that :-) How would I just 'go to' a label (or an
address). If I do 'Find/Address' it does not seem to work.

>No it never has. If you know someone to do it....

I know some German. This helps a little (only a little!!) with the
Dutch.

68000, you mean? Otherwise I recommend the Frankenstein crossassembler :)

I think some implementations of gcc do this. (At least the Solaris
version at school can,I think).

I am running Mint 1.14.7 with mintos on a TT030 with 4 attached
terminals.
 When running several instances of the same application, are file
handles for disk files the same over the system regardless of which
application is opening a file.
 eg: If each process uses file # 48 for a particlular file, and one
tries to access the file while it is already opened by the other
process, does the system handle this file as the same for both

processes, namely reporting the file is already opened, or as seperate occurances.
 As I have mulitple iterations of the same process on terminals, these processes of course treat files in exactly the same manner.
 Also when a file is opened, is time sharing stopped until the file is closed.
 I occasionally have a program quit when 2 terminals try to access the same file a the same time.
 This problem only occurs on rare occasions, about 4 times in over 1000 hours of running.
Any suggestions that will help clarify this would be appreciated.

I think you'll have to be more specific. I don't use PureC myself -
does it allow inline asm for instance?

There's a chance the problem might be due to pc-relatative code

generation or short branches - but I'd expect some kind of compilation message if that were the case. Generally speaking though, it's more likely to be simply a logical flaw or register corruption and that the size is co-incidental.

I have experienced the occasional going into "limbo" of Lattice under MagiC after launching another program within the shell. You usually can get back to Lattice, however, as long as you finish the process launched under the shell. Sometimes Lattice seems to have disappeared even after the process is closed. Something silly, like closing a window in Magxdesk, usually restores it to its proper place in the MagiC list of active programs. I have no idea why that is.

It is simple: place the cursor in the labelname you find in an
instruction and klick.
The logical action you can espect is: jump in listing to place of
label.
Go back to where you came from: Undo? Yes!

Hmm, double darn! I've had rsrc_load() fail on me in the past. No idea
why at the time though - it was years ago I wrote my own Rsrc_Load()
to fix it by having it go through PATH if the initial rsrc_load()
failed.

>> Tos programs have to rely on Dgetdrv(),Dgetpath().

Unfortunately docs on that are vague also. You may only get the
program name.

>But
>it's not guaranteed that argv[0] contains a path,

or anything at all!

>and as a TOS program
>may have been run from a completely different directory, it's actually
>impossible to get the program's path in call circumstances.

Agreed.

>You can only be sure about it if argv[0] is set _and_ contains an

Also agreed.

Hey that reminded me about this. It's yonks old and was never tested.
Question is folks: would it work? Wierd MWC assembler syntax again of
course!

```
     .globl   _cp_irq_

     .shri

_cp_irq_:
//*[ uint cp_irq(andv,xorv)
/    uint andv;
/    uint xorv;
/
/ the processor interrupt mask is read, then ANDed with andv, then
XORed with
/ xorv and then written back to the interrupt mask. This enables it to
be read
/ or written in any manner. The interrupt mask which was written back
is
/ returned to the caller. For the 68000 the interrupt mask is 3 bits
and is a
/ value in the range 0 to 7.
/
/ _cp_irq() can be called from user or super state. It sets IPL to 7
while it
/ builds the new status register and shifts straight from level seven
to the
/ level required by the caller once it has done so. This does not
imply that
/ interrupts cannot occur during this call, simply that if one does,
the status
/ register contents, as opposed to condition code register, will
either be in
/ the original or required state (not partially built).
/]*/
     link a6,$-2             /flag for proc state
     jsr  _cp_stat_     /test current state
     move.w   d0,-2(a6)     /save state
     bne  SuperObtained      /already super state
     jsr  _cp_sup_      /obtain super state
SuperObtained:
     move.w   sr,d0
     ori.w    $0x0700,sr         /only NMI allowed
     lsr.w    $8,d0              /move irq mask to match input
mask
     and.w    8(a6),d0      /irq mask AND andv
```

```
     move.w   10(a6),d1     /xorv
     eor.w    d1,d0              /irq mask XOR xorv
     andi.w   $7,d0              /ignore unwanted bits
     move.w   d0,-(sp)      /return value to caller
     lsl.w    $8,d0              /shift new mask to match sr
irq bits
     ori.w    $0xf8ff,d0         /build rest of sr
     move.w   sr,d1              /NMI only irq mask
     and.w    d0,d1              /required mask
     move.w   d1,sr              /shift from NMI only to
required mask
     tst.w    -2(a6)             /old proc state
     bne  KeepState     /stay in super state
     jsr  _cp_usr_      /back to user state
KeepState:
     move.w   (sp)+,d0      /mask written to caller
     unlk a6
     rts
```

And I guess this doesn't qualify as a good reset function does it:

```
Reset()
{uint16  x    =0x4e70;
 void    (*fcp)()=&x;

 (*fcp)();
}
```

Hmm, forgot the RTS!

Oh, and just what is that compiler switch that forces a local variable
to be placed in the TEXT segment? :-))

Newsgroups: comp.sys.atari.programmer

Hi guys,

I trying to solve a long-standing problem I have relating the text cursor, specifically with OBJC_EDIT.

I'm using a heavily-modified version of Flydials, and I've noticed this behaviour in other GFA Flydial-dependant programs (for example, Ergo!pro has this bug), and it's a right pain!

Basically, I have a window with an editable text object in, and the text cursor is enabled. In general, the cursor is turned off and on with:

```
    ~OBJC_EDIT(rsc_adr%,edit_obj&,key&,idx&,3,idx&)   !Turn cursor OFF
    ~OBJC_EDIT(rsc_adr%,edit_obj&,key&,idx&,1,idx&)   !Turn cursor ON
```

But, if another window is moved over the cursor, GEM won't redraw it as part of the normal window redraws, so the cursor disappears. On switching back to my application, I need to be able to properly redraw the cursor. Now GEM or GFA seems to be drawing in a kind of XOR mode, so if the cursor is turned on and redrawn when the cursor hasn't been erased by the window, the cursor will then disappear, only to reappear when the cursor position is moved and giving redraw errors. So, I know this is kind of difficult to explain, but what I need to know is an accurate way of turning off and on the cursor, and redrawing it. CoNnect, as an example does this properly - when switching back to a CoNnect window, the cursor is turned off and then properly back on, which is exactly what I need to do. Any ideas..?

Thanks!

I do not really understand this, partially because information is missing
(like the AND and XOR masks), but to me, "written back to the interrupt
mask" and "can be called from user ... state" is a contradiction.

What's the goal of this bit ?

Cheers Peter

No, the TCP state is not directly accessible in public versions of STinG.
You can wait for a specific TCP state using TCP_wait_state(), or just
call CNbyte_count() it'll return ELISTEN until the connection becomes
established. The latter is the usually used method.

> Then I start the 'active' program, that opens a connection to 127.0.0.1

There must be a bug in your code checking for data. Try a version that
collects data using CNget_char(), at least that should work alright.

> Nevermind. But shouldn't the transfer be quite quick, since it's done on
> the same machine?

Yes, it should. Depending on what you configured as delay, data should
arrive in a time as short as 10 ms.

Greetings atarians!

I'll repeat myself and ask a question I've asked before, with a little extension:

>Is it possible to write the image contents of an object tree to memory

>(without viewing it on screen first), or do I have to draw the object on
>screen, and then save the screen contents to memory??

When I asked this I got the answer 'no', from (I think) Jo Even Skarstein.

Now I⌂ve read somewhere on the WWW that it is possible to use something called 'sceen swapping routines' to redirect the output to a dedicated place in memory instead of the physical screen adress.

Could this be used to do what I asked for? Anyone?

Thanks in advance,

Joakim

This sort of thing is a pain unless you have *full* control of the cursor. I suspect that programs that handle this correctly are managing their own cursor draws. I know that in my programming I have a standard bitblit procedure which I then use to "create" blinking or steady cursors at will. Since I am in control, I can effect redraws as required, e.g. as part of the normal redraw process.

But it does work to check the remote IP, right?

Hmm, I did find a bug, but it had only something to do with the printing
of the remote IP in the passive program. It now prints 127.0.0.1 and not
48.0.0.140.

But I think CNget_block is so simple, I can't figure out what's wrong.
Okey, I'll test CNget_char , but isn't that one quite slow, since it
only gives me one byte at a time? I heard that CNget_NDB is the fastest
way, but forces me to KRfree the block(s) also.

See ya
Henrik

Hi!

Joakim H⍰gberg <fiolerna@al_ALBATROSS_gonet.se> wrote:
> -Is it possible to specify the WORKarea of the GEM-window with wind_set?

Not directly. But you can use wind_calc(WC_BORDER, ...) to calculate the
position and size of a window with a given workarea, which you then use
with wind_set().

Ciao

Thomas

The programmer does have complete control over the cursor, by calling objc_edit
with the proper function codes. I know the documentation of this function is
not very good, but is does work.

From memory : ED_INIT shows the cursor, ED_END removes it. ED_INIT can be used
in redraw code too.

Cheers Peter

No. You need to call wind_calc first to calculate the total area from the
working area, then call wind_set to set the calculated total area.

Well, now I've found the bug, and of course it was one of the most
simple things possible. I'd calculated the wrong offset for CNget_block,
I thought it was 72bytes from the start of TPL but when I calculated it
again I got 76. So I've been calling CNkick all the time. No wonder it
didn't work. :-P
But now it all works perfectly, and the multiplayer option seems
possible after all. Thank you very much for your help, Guy and Peter and
everyone else!

Regards
Henrik

Subject: Bad RAM? Or programming error?
Date: 1998/09/23
Message-ID: <6u9s45$m17$1@newshost.comnet.co.nz>#1/1
X-Deja-AN: 393901145

Organization: Comnet Technologies Ltd, Wellington, NEW ZEALAND
Newsgroups: comp.sys.atari.programmer

While testing a system-level utility I am writing, my TT crashes/hangs.

The code where it crashes looks like this:

```
     move.w   #%01,-(sp)         ; TTRAM only
     move.l   #(4<<20)+65536,-(sp)    ; 4 MB + 64k
     move.w   #m_xalloc,-(sp)         ; Malloc with pref
     trap #1            ; call gemdos
     add.l    #2+4+2,sp ; fix stack
     tst.l    d0        ; null = fail
     beq  fail
     tst.w    d0        ; aligned on 64k boundary?
     beq  aligned       ; yes, so no need to realign it
     add.l    #$10000,d0    ; increment pointer
     eor.w    d0,d0         ; zero low 16 bits
aligned            ; D0 is usually around $01200000
     move.l   d0,a0     ; a0 = pointer
     move.l   #((4<<20)>>2)-1,-(sp)   ; split d0 into d0/d1
     movem.w  (sp)+,d0/d1   ; d0/d1 now have high/low words of counter

tol  ; top of loop
     clr.l    (a0)+     ; IT CRASHES HERE when A0 > $01400000
     dbf  d1,tol    ; clear 64k
     dbf  d0,tol    ; multiples of 64k
```

Everything seems to be OK until A0 reaches $014xxxxxx.

Shortly after this, the TT hangs badly - which it should not do, as I have 16 megs of TT RAM, so the end of RAM would be $02000000 - a good 12 megs beyond where it crashes.

However, debugging reveals that memory at $01400000 is a direct copy of $01000000. Likewise $01800000. And $01C00000.

I took the top off the TT and checked the RAM was properly inserted and the memory board was properly pushed into the fast ram slot of the TT.

But the problem still occurrs.

Do I have bad RAM, or is it something else?

--

I wouldn't call that a full control. You can't e.g. set the clipping
rectangle at all with objc_edit().

Given that your external window size and work area are related depending

on which window widgets you have active, yes. You convert the required
internal work area size to window external x y w h using wind_calc, and
then set the window size using these values. Using wind_calc the other
way, you can figure out the effective work area from a given window size.

The latter. Note that TT RAM starts at $01000000 (16M).

It should.

> But I think CNget_block is so simple, I can't figure out what's wrong.

CNget_block has a pitfall : It does not return any data if the buffer you want it to fill in is larger than the amount of data that has arrived. So you'll never receive any data if you try

```
   CNget_block (handle, buffer, 1024);
```

but your sending client only ever sends 1000 bytes. Only 1000 bytes will ever arrive, so the buffer, being 1024 bytes large, cannot be filled in completely.

I know this is stupid, but it was decided this way by Steve Adam when he created STiK, and I cannot change it without breaking compatibility.

According to the Atari docs I have, TT RAM space ends at $013FFFFF and
memory from $01400000 to FE000000 is reserved. Why do you need to go into
this space?

See my website for "The Atari A to Z" book shareware ASCII files. There is an
extensive memory map in that.

Hi guys

I've been struggling to convert some C code (taken from NOS) that does a
wildcard matching of two strings; one string and a pattern.
The pattern should be able to contain wildcards such as *, ? etc.
I'm struggling with how to code it so that the following match is detected:

string = alt.fred.rec.pets.gary
pattern = *.rec.pets.*

The above example should match, but I just can't get my head around the
required code :(Trailing stars are obviuosly easy, but it is the leading
star, followed by actual data..... bit that is causing me headaches.

Does anyone have an assembler routine that does this? I'm not that good with
C and really would like an assembler routine.

Thanks for any help,
Gary

Everything in excellent condition.
800 unit
18k built in
58 k added memory (3x16, 1x10)
cables, ac adaptor
810 floppy drive
users and programming manual
game cartridges
basic (language) cartridge
two joysticks and cables

$70 or best offer nearest to it.

buyer pays shipping to their location.

> this space?

Well, my 18 meg TT (16 Meg TT RAM, 2 Meg ST RAM) definitely has memory in the range $1000000 - $1ffffff. Perhaps Atari originally designed a TT RAM expansion board which could only handle 4 Megs, and made a 16-Meg capable one later?

To the original poster: If your RAM isn't unique from $1000000 - $1ffffff, you don't have 16 Megs of functional RAM. (This I should know, I'm working with malfunctioning RAM at work right now, and I have been dreaming in hex lately 8^)

If you do really have 16 megs of TT RAM, perhaps the jumpers are just set wrong on the expansion board.

Hi all,

I've been working on some tools to let me build PalmPilot applications using my Atari. Basically they take a .PRG or .TOS file and convert it to a PalmOS .PRC file which can then be HotSynced (not on Atari yet -- you need a PC, Mac or Linux to do this right now) and run.

(Anyone working on Hotsync software that will run under single-TOS?)

(For those who don't know, the 3Com PalmPilot is a handheld organizer that uses a Motorola DragonBall CPU -- basically a 68k with extra stuff).

Current support is only for assembler programs (Devpak) and single-pass assembly (no linking), due to the memory model of PalmOS programs.

I posted this here due to the fact that only Atari-heads would be possibly interested in this.. is there anyone else out there trying to program their PalmPilots without using Wintel hardware? Once I fix some more really bad bugs and clean things up I can post them to my web site if anyone's interested.

I've proted the pilot-link utilities to MiNT so you can hotsync with an Atari computer using MiNT.The irl is :
HTTP://www.chez.com/stratos/pilot.htm

I've try to port Pilot GCC under MiNt but for the momment it doesn't work.

best regards, Rodolphe.

Hi everyone!

Thanks to Peter and Guy, I now have two working programs that sends/receives data using STiNG. One of them is passive, the other active.
I run the passive program first. It initialises a passive connection, and then waits for the active program to open a connection to it (loop-back: 127.0.0.1) and send some data.

It works fine to read the data using CNget_block, but since I'm going to use all this in a game, speed has the highest priority. I have therefore tried to replace the use of CNget_block with CNget_NDB. I read in STING.HYP, that I have to KRfree both the incoming data blocks and the NDB structure associated with each block after having processed them.

According to STING.HYP, an NDB consists of a pointer to the base of the block, a pointer to the data of the block, a word saying how many bytes the data is, and a pointer to the next NDB-structure (if there is any).

My passive program waits for the connection from the active program, and then waits for 30 seconds, to give me (the user), enough time to write two small strings of text in the active program and send them to the passive one.
I successfully manage to read the first NDB and its data, but when I try to process the next NDB, the system crashes. Magic reports "systemstapeln ⌂berlaufen", which I interpret as the system stack having been thrashed in some way.

I use the last pointer (*next) in the first NDB-structure to get the address to the next NDB. Is this correct?

the pseudo code for the NDB-processing is like this:

1. call CNget_NDB with the handle
2. was the returned pointer in d0=0? if yes: quit.

3. use the pointer to get the address to the data of the NDB

(*ndata), and how many bytes to read (len).
4. use a small loop to copy the data from the NDB to a buffer,

null-terminate the string, and print it.
5. check the last pointer (*next) to see if there is another NDB to
process. If zero, goto 7.
6. KRfree both the data pointed to by the NDB (*ndata) and the NDB
itself. Goto 3.

7. do the same as 6, except that we don't jump to 3, since the NDB's
are finished now.

I'm cautios about not relying on a0-a2 and d0-d2 after having called KRfree, CNget_NDB or Cconws. Is it correct that the address to the block that I want to free using KRfree, should be passed on the stack?

Regards
Henrik Gild⌂

I have a Falcon running MagiC 5. I would like to write some programs under this OS. What kind of languages are available? Is there any thing like Visual C++ or Visual Basic. Any object oriented options? I would like to be able to use GEM functions. In other words be able to put a nice GEM front end on my programs.

Getting down to the last of the Atari ST items on my shelves. This group includes many of the ABACUS Atari ST Series from Germany.

These books are especially valuable sources of ST info. They haven't been available for many years, and when they're are gone, the information in them pretty much goes with them.

Priority Mail shipping is $3.00 for one or two, or they can be sent at Book Rate which is a little cheaper (and a lot slooower).

Misc. Atari ST Books - $10 each

Compute's ST Programmer's Guide -

The comprehensive guide to programming the Atari ST personal computer. Includes dozens of example programs, details on how to access advanced features and explanations of BASIC and LOGO. Includes writing GEM applications in "C".

Programmer's Guide to GEM - Sybex

A detailed introduction and reference guide for anyone wishing to develop applications for the GEM operating environment. Programming the VDI for portable graphics software, using the Resource Construction Set, a complete guide to AES functions and lots of programming examples in C.

GFA BASIC Book - MichTron

An intermediate programming tutorial for GFA BASIC, written by Frank Ostrowski, the author of GFA BASIC itself. It's designed for the person with a casual knowledge of BASIC who wants to gain an understanding of the more complicated aspects of the programmers' art. It guides you step by step through many intricate facets of BASIC and GEM programming, using GFA. Comes with a disk containing many of the program examples. This book is especially valuable for the practical insights Frank gives from his years of development on the ST.

ABACUS Software Atari ST books - $10 each

Volume 2 - Atari ST Internals -

The authoritative insider's guide. Chips, MIDI, GEMDOS, Sound, BIOS, Interrupts, Errors, almost everything you need to know about the ST.

Volume 3 - Atari ST GEM Programmer's Reference -

The complete guide to programming the ST using the Graphics Environment Manager. GEM, VDI, AES, GDOS, GIOS, programming, development, compiling C, inside GEM. Many example programs in C and 68000 assembly language.

Volume 4 - Atari ST Machine Language -

Complete introduction to machine/assembly language on the ST. Logical operations, bit manipulation, program development, 68000 register structures, memory structure, operating system, and more. Many examples and problems with answers.

Volume 5 - Atari ST Tricks & Tips -

Valuable collection of software tools and programming hints. Using GEM from BASIC, adding machine language to BASIC programs, super fast

RAM disk, print spooler, starting TOS applications automatically and more. Contains program listings and color plates. A collection of info that didn't quite fit into the other volumes.

Volume 8 - Peeks and Pokes -

Keys to revealing the secrets hidden within your Atari ST. Using the BASIC "Peek" and "Poke" functions to: Customize the desktop, change the mouse shape, change the character set, read the keyboard or joystick, make your own fill patterns, direct disk accessing, system variables, pointers and the CPU stack, setting up the RS-232 interface and a lot more. This book packs a lot of valuable information all in one place.

Volume 9 - Atari ST BASIC Training Guide -

Everyone's introduction to ST BASIC. A very functional, educational and well-written introduction to ST BASIC. From problem analysis to algorithms to BASIC commands. It helps teach programming quickly. Includes quizzes on the concepts introduced to reinforce the learning of programming.

Volume 11 - Atari ST BASIC to C -

Move quickly beyond the BASICS with the powerful C language. Use your knowledge of BASIC to move on to programming in C with the help of this useful guide. Shows comparisons between the familiar concepts of BASIC and the equivalents in C to make moving into this more powerful and versatile programming language very easy. Many, many programming examples.

Volume 12 - Atari ST 3D Graphics Programming -

Concepts and techniques. Learn how to create impressive and fascinating 3D graphics on the ST. Covers the basics, then moves on into more advanced concepts. 2D & 3D transformation, hidden lines and surfaces, data structures, spatial projection, screen manipulation, rotation, light and shadows, and more. Includes many programming examples in 68000 assembly language.

Volume 13 - ST Disk Drives: Inside and Out -

Discover the capabilities of the Atari ST disk drives. A book with in-depth coverage of the concepts and techniques of using floppy disks, hard disks and RAM drives. The book explains in detail the file structures, software, firmware and hardware that support disk functions on the ST. BIOS, DMA, controllers, tracks, sectors, clusters, gaps and FATs. Includes an extensive description and

listing for a full-function disk monitor program to help investigate
the ST's disks. Lots of info in this one.

I'd just as soon pack all of these into one big (and heavy) box, so
make me an offer on all of them, or bundles.

If you're planning on sticking with your ST, or are new to the world
of the Atari ST, you need these books!

There is some kind of VisualAssembler... but for C no. Basic I don't know but
I don't think so. For C++ there is GCC which is also free and one of the
best compilers available. Where to find it, I don't know but most ftp
sites should have it.

Hello,

I've finally managed to get round to installing Lattice C5.52 on my Falcon so that I can teach myself C, but I've been having problems:

The cascading menus in the Integrated Development Environment (IDE) can not be selected.

This is the case if I use TOS 4.04 or Magic 5.11.

If I use Geneva the menus work. However...

Both Magic and Geneva do not allow me to run the DEMO2 program from within the IDE - well it runs, but then I cannot get back to the IDE after pressing a key. (Yes I have followed the tutorial and corrected the intentional errors so it compiles and links correctly). The Geneva task manager shows that Lattice is asleep and that the child program, i.e. PROG2 is running. It is not possible to terminate either task in Geneva or Magic.

Has anyone got Lattice C 5.52 to run satisfactorily on a Falcon, preferably under Magic? I'm beginning to feel that the only way I will be able to use it is in single-tasking mode under Geneva.

Any information/experience/help much appreciated.

Thank you,

Michael

Not 5.52 but 5.60 (I think.....) works just fine under MagiC. If there is a
problem
with 5.52 or not I have no idea. Ask HiSoft. ;-)
